

AMERICAN SAMOA 2015 HIES

HOUSEHOLD INCOME AND EXPENDITURE SURVEY REPORT

The 2015 HIES is a 20 percent sample survey providing current updates on demographic, social and economic characteristics of the resident population since the 2010 Census. Included also in this study are income distributions and spending patterns of American Samoa families.

FOREWORD

The 2015 Household Income and Expenditure Survey (HIES) is the fifth survey of the American Samoa Expenditure Series since the first one in 1982. The HIES collected information on demographic, social and economic characteristics of the resident population, as well as expenditures and family spending patterns drawn from a 20 percent systematic sample of households in American Samoa. The main objectives of the survey are:

- To provide new expenditure weights and a “market basket of goods and services,” for the revision of the American Samoa Consumer Price Index.
- To supplement personal consumption expenditure in compilation of National Accounts and Gross Domestic Products.
- To obtain selective eating habits and nutritional intakes of residents.

The tabulation report presents summaries of key findings as well as detailed tables of subject matter crosstabulations useful for planning and policy decisions.

The survey was funded with a technical assistance grant from the U.S. Department of the Interior’s Office of Insular Affairs (OIA). OIA funded simultaneous grants to American Samoa, CNMI, and the Virgin Islands for the 2015 HIES surveys as they did for the 1995 and 2005 rounds.

Many individuals and organizations provided assistance for the successful completion of the HIES. I extend my deepest appreciation to the Department of Interior, Office of Insular Affairs for funding this project. And to Dr. Michael J. Levin for data processing utilizing the CSPro software; Mr. Brian Hannon, a Washington DC based Price Statistics Consultant who worked on the Consumer Price Index Revision, and all those involved in the field enumeration and processing of the HIES survey. I want to pay special tribute to former Chief Statistician Mr. Etuale Tuileta for leading this work and the Department of Commerce staff for their unwavering support.

Fa’afetai fa’apitoa mo aiga uma o Amerika Samoa na filifilia mo lenei galuega. O lo outou sao ua mafai ai ona tu’ufa’atasi ni fa’amaumauga taua mo le fuafuaina o atina’e ma le tamaoaiga, aua se manuia o Amerika Samoa ma ona tagata.

2015 American Samoa Household Income and Expenditures Survey

Report December, 2016

1. Introduction

The 2015 American Samoa Household Income and Expenditure Survey (HIES) report presents current information on demographic, social and economic characteristics of the territorial population as well as expenditure details of what families and residents spent their money on. The 2015 HIES is the fifth survey of the expenditure series since the first one in 1982. The main objectives of the survey are:

- To provide new expenditure weights, identify items for a “basket of goods and services,” determine where people purchase goods and services, and other useful expenditure details for the revision of the American Samoa Consumer Price Index.
- To supplement personal consumption expenditure in compilation of National Accounts and Gross Domestic Products.
- To obtain selective eating habits and nutritional intakes of residents.

The survey was funded with a technical assistance grant from the U.S. Department of the Interior’s Office of Insular Affairs (OIA). OIA funded simultaneous grants to American Samoa, CNMI, and the Virgin Islands for the 2015 HIES surveys as they did for the 1995 and 2005 rounds. These grants provide funding to produce individual market baskets and Consumer Price Indexes (CPIs) as well as allowing for comparability across the U.S. Insular Areas as well as with the U.S. itself.

2. Survey Methodology

A uniform sample design was adopted in all islands. The HIES used a 20 percent systematic sample of all households in the following islands: Tutuila (divided into Eastern and Western Districts), Aunu’u island and the Manu’a islands of Ta’u, Ofu and Olosega. American Samoa’s 2010 Census list of villages and households served as the Sampling Frame. A mapping and household listing operation was carried out in each sample area and the listing provided the necessary frame for selecting households. The households to be interviewed were selected with equal probability from the household list in each area using systematic random sampling. As is done in previous HIES, both a diary and a household questionnaire were used in the survey to gather household income and expenditure. The diary portion of the survey was left with each of the cooperating households for one week.

3. Survey Instruments

The questionnaires resembled the questionnaires developed for the 1995 and 2005 Household Income and Expenditures Surveys (HIES). Similar questionnaires have been administered in the United States Virgin Islands and in the Commonwealth of the Northern Mariana Islands. Two questionnaires were used:

- (1) A “regular” question that had items for housing, population, and regular and annual expenditures; and,
- (2) A Daily Diary for all members of the household to record their daily expenditures on food, entertainment, and other items for a whole week.

Most of the expenditures items were the same as in the 2005 HIES, and so were brought up to date. And, Brian Hannon, the economist developing the market basket to be used for the Consumer Price Index, also provided new items, which were then available for coding.

The survey used Census Bureau conventions, as have all surveys since the 1980s in American Samoa. Each enumerator had a booklet of Enumerator Instructions which outlined the procedures – how to find the units, how to introduce themselves, how to work in difficult situations, and so forth. They also carried a Questionnaire Reference Book (QRB) which covered each question on both forms – how to ask the question, what the information is used for, special cases and potential problems.

Each enumerator also carried an Address Register where they recorded daily progress, including how many units they went to in a day, how many were enumerated, how many partially enumerated, and any problems. They also carried forms called “Sorry we missed you” if no one was at home so the respondent could call in to set up a time for the initial enumeration. Another form was the Individual Survey Form to be used when one person was away from the house at the time of enumeration which the enumerator would collect later. They carried a document that explained the confidentiality of the census to the respondents. And, finally they carried a Refusal form to be filled when the respondents refused to be enumerated.

Each household received a diary when the first visit was completed, but many of the households did not fill them out.

Also, to make sure all enumerators were trained exactly the same, and to be consistent with U.S. Census Bureau procedures, a Guide for Training Enumerators was prepared based on the previous HIES, but updated for current changes in the expenditures. The Guide was developed to be read verbatim at all training sites to keep consistency among the enumerators and supervisors.

4. Field Operations

Etuale Tuileta was the Chief Statistician at the beginning of the 2015 American Samoa Household Income and Expenditures Survey. Under his direction, the sample was determined and the enumerators and supervisors were identified. Most of the enumerators and supervisors were Department of Commerce or other American Samoa government employees.

A single centralized training workshop was held to train interviewers, supervisors and other staffs and the standard procedures discussed in the Training Workshops by providing necessary survey manuals. The purpose of these workshops was to ensure uniformity in data collection procedures. Each

interviewer was required to make a minimum of three callbacks if no suitable informant was available for the household interview at the time of the interviewer's visit.

The field supervisor was responsible for the overall management of the field team. The main responsibility of the field supervisor was to examine questionnaires for completeness, consistency, legibility of the information collected and to ensure that all necessary corrections and clarifications were made while still in the field. An additional duty of the field supervisor was to observe ongoing interviews and verify the accuracy of the method of asking questions, recording answers, and following skip instructions. The field supervisor also applied quality assurance procedures by conducting spot checks to verify the accuracy of key information.

5. Data Collection Procedures

Levin developed an Office Operations Manual for checking, coding, and keying the American Samoa 2015 HIES. A second stage review and verification of questionnaire were done at the office during the coding and data entry. Special attention was paid to missing information, skip instructions, filter questions, age, and income and expenditure information etc. Questionnaires with too many invalid and inconsistency entries were returned to the interviewing teams and their supervisors during the fieldwork so that their performance could be improved. If major problems were detected, the interviewers were required to revisit the respondent to rectify the inconsistencies.

6. Field Supervision

The field supervisors were all trained at the same time as the enumerators and had extra time spent in learning the quality control monitoring procedures for the survey. All field supervisors were government employees as were most of the enumerators, and all continued their regular jobs during the survey work. Enumerators were assigned to areas either where they lived or near to where they lived. Supervisors were assigned to their areas in a similar manner whenever possible.

Enumerators were to go to 2 or 3 housing units each day and to record their visits on the Address Register. When enumerating, they recorded whether they could interview anyone in the unit, whether they needed to return to complete the interview for the regular questionnaire, or whether no one was home and they were going to have to return to do the interview. If no one was home, enumerators left a "Sorry we missed you" form. If the respondents refused to be interviewed, the enumerator filled a Refusal form, and gave that to his or her supervisor. The field supervisor then returned to the unit to attempt to collect the data.

Enumerators either left completed questionnaires or returned them to the processing office after the supervisor signed off. Sometimes the supervisor returned the questionnaires him or herself. Unfortunately, the enumeration continued for a considerable length of time and so not all procedures were followed exactly.

The 2015 survey was a survey of households only, based on the U.S. Census Bureau definition of a housing unit – direct entry and living together – and so some units could have more than one household. In this case, the sample selection instructed the enumerator as to which household to enumerate. No institutions were included in the survey.

7. Data Processing

As noted above, when the questionnaires arrived in the office, they were checked in, and then they were quickly checked for completion. If only a few items were missing or inconsistent, the questionnaire was accepted, and was not sent back to the field. When too many errors occurred, the forms were given to the supervisor to pass to the enumerator to complete the work.

Regular questionnaires that passed the original office review were passed to staff who were trained to put codes in the keying boxes to make the keying go more quickly and easier, to code certain items from a list either on the questionnaire or in a separate Office Operations Book, and to code items such as places, languages, occupations, and industries that required separate booklets.

Diaries had their own code lists. Except for the items themselves, the enumerators were instructed to fill amounts, quantities, costs, and whether purchases were paid in cash or credit. The enumerators also entered gifts given and gifts received separately.

CSPro (census and Survey Processing), a U.S. Census Bureau computer package to assist countries around the world with their census and survey processing, was used to process the 2015 HIES. CSPro is an integrated package. A Data Dictionary is developed based on the questionnaire or questionnaires, and the other elements all play off this dictionary. The dictionary has each item, in question number order usually, with separate record types for the different types of records. So, one record is for population items, one for housing, one for house construction and repairs, one for education expenses, and so forth.

The dictionary is used in all subsequent phases of the survey processing. The three phases for this survey were (1) data entry, (2) editing, and (3) tabulation. Staff were trained and used PCs to enter the questionnaires after they were checked and coded. CSPro's entry package was used for data entry. Levin developed the entry screens based on the two questionnaires. When the dictionary and entry screens for the 2015 HIES were in place, Joseph Meredith installed them on four machines, and provided training for the keyers, who were also, for the most part, enumerators as well.

Because the enumeration was slow coming in, the entry was also slow. Levin used the edit part of the CSPro package to develop the edits while he was still in American Samoa, but he then returned to Hawaii to continue the work there. Both the regular and diary files were sent on a continuing basis over several months. When it appeared that all diary questionnaires were sent and concatenated, Levin worked with Brian Hannon in Virginia to obtain the runs needed to do the factor analysis and develop the market basket. However, after Levin returned to Hawaii, it turned out that more questionnaires were still coming. The team had a small problem with quality control over the tracking of the questionnaires. Too few questionnaires had arrived from Manu'a, and no diaries were done there so that a separate market basket and CPI would have been impossible.

Vai Filiga returned to the office at the first of the year, 2016. He sent enumerators to Manu'a to finish the enumeration there. Levin traveled to American Samoa a second time in April, and worked with Filiga to develop a data set based on the keyed data for one and only one questionnaire for each enumerated household. Because of miscoded geography, some work was needed to rectify miscodes and obtain the same IDs for the regular and diary questionnaires, when the questionnaires were present.

Levin then returned to Hawaii and finished the edit for the two sets of questionnaires. The edited and unedited data were sent to Hannon for his use in developing the market basket. Levin then made the sets of tables that appear in the last section of this report.

8. Tabulation

For the 1980 U.S. Decennial Censuses of the Insular Areas, Levin developed sets of crosstabs that have been used in all subsequent censuses and surveys. The method crosses many of the population variables by all the other population variables, and crosses the first geographic level by the housing variables. This method was used in the 1990 and 2000 American Samoa censuses, to an extent in the 2010 census, and in the household surveys for 1995, 2005, and 2015.

The population sets of columns used in 2015 were:

- (1) Geography
- (2) Age
- (3) Birthplace
- (4) Citizenship
- (5) Education
- (6) Work and Class of Worker
- (7) Occupation
- (8) Industry
- (9) Income

These were crossed by most of the other population variables. The results appear in the last section of this report. The housing variables were only crossed by the American Samoa counties.

9. Accuracy and Estimates

American Samoa has a continuous mapping operation to try to obtain a constant universe of all housing units. As noted above, a systematic 20 percent sample was determined for all islands based on the 2000 Census geography and updates. As with all surveys, the sample was not complete, and while efforts were made to use substitution in cases of vacants and refusals, in the end, 20 percent was not achieved. Because of this, a weight was used to inflate the results to the expected total of units based on the 2000 census results and changes over the 5 years. This weight was added to the housing records and was applied in the tabulations shown in the last section of this report. Sample weights were calculated for the three districts to determine completeness. In total there were 1,838 households that completed a questionnaire form from a sample of 2,098 selected housing units. The final sample weight of 5.99668 is the average of the sample coverage of the three districts.

It is important to note that this sample weight was used for housing, population, annual and regular expenses when tabulations were inflated to the totals for the whole territory. Hence, the population in the units reflected the housing weight and not individual weights.

Fewer diaries were collected than regular questionnaires. Hence, while the total number of expected households in the territory remained the same, the weight for the diaries was larger than the weight for the regular questionnaires. Only 503 households completed a diary. The final weight for the diary form is 20.8548. The same weight was used for all counties.

Unlike the United States and Puerto Rico, which collect several monthly surveys, and Guam and the U.S. Virgin Islands, which collect annual surveys, American Samoa collects only a single survey at the mid-point of each decade. Hence, while Decennial censuses were collected in 1990, 2000 and 2010, the only mid-decade surveys are these household income and expenditures surveys. The accuracy in terms of coverage is only as good as the updating of the maps and the enumerators doing their jobs of on-the-spot updates.

On the other hand, the American Samoa Statistics section of the Department of Commerce is known for its excellent work in content. The population and housing questions contained very few errors – neither invalids nor inconsistencies – needing rectification during the CSPro editing process. CSPro keeps track of the errors; the results of the item by item edits are available at the Department of Commerce.

It is much harder to assess the accuracy of the regular and annual expenditures and the diary items since these data are only collected every 10 years rather than every 5 years as with the population and housing items. Also, it is known that many respondents under-estimate their purchases, either because they are embarrassed about the amount of a type of food (like fast food) or activities (like petty gambling), but more often because they just forget to include items.

Because the survey was a sample, all results are estimates based on the actual information collected, the editing, and the weights used.

10. ANALYSIS

10.1. POPULATION CHARACTERISTICS

The weighted number of residents in American Samoa based on the 2015 household survey was 57,436. Tualauta county had the largest estimated number at 19,519, followed by Maoputasi at 11,052. Hence, those two counties made up more than half of American Samoa's population in 2015. The five counties in Manu'a together accounted for only 1,300 people, and, as one entity, it is the smallest in American Samoa. Other small counties were Leasina with 1,541 and Saole with 1,811.

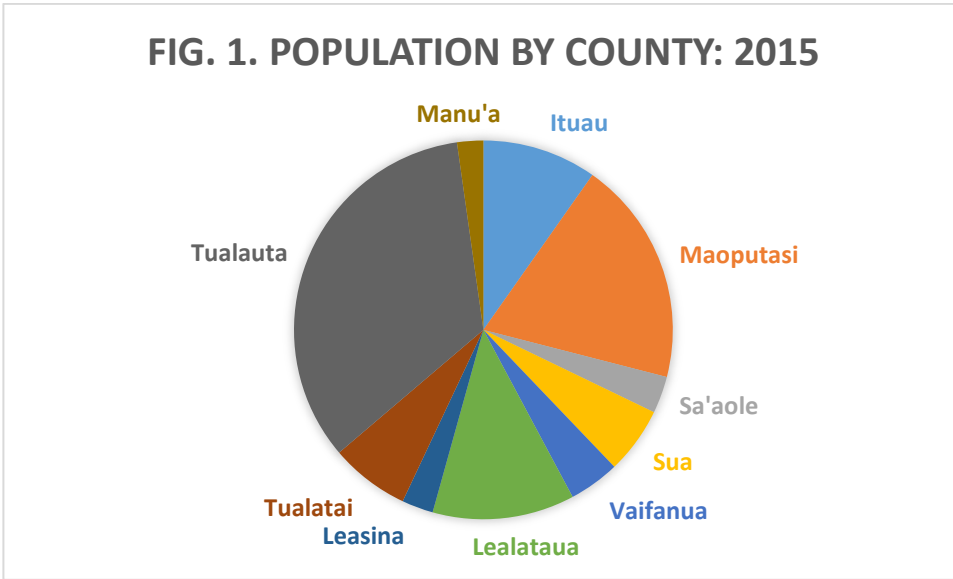

American Samoa had more females than males, but some counties, like Tualauta at 114 males per 100 females and Leasina with a sex ratio 107 were more male than female. As shown in the charts below, the median age was 25.3 for the whole territory, significantly below that seen in the United States itself. Many of the other characteristics in the table below are discussed with the following charts.

Table A. Selected Population Characteristics by County, American Samoa: 2015

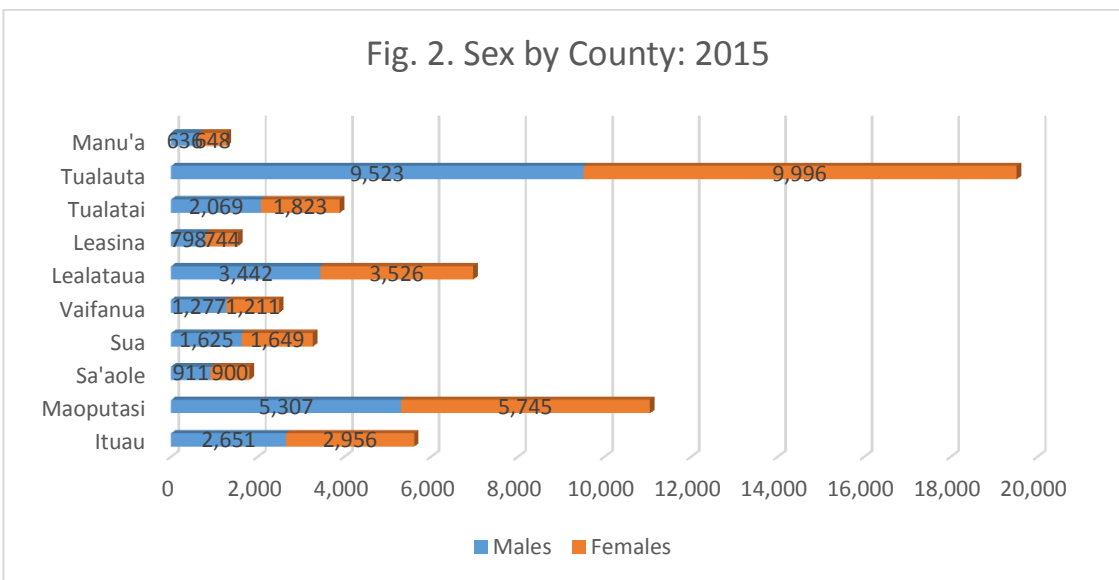

Characteristics	Total	Ituau	Maoputasi	Saole	Sua	Vai-fanua	Leala-taua	Leasina	Tualatai	Tualauta	Manu'a
Total	57,436	5,607	11,052	1,811	3,274	2,489	6,968	1,541	3,892	19,519	1,283
Males	28,238	2,651	5,307	911	1,625	1,277	3,442	798	2,069	9,523	636
Females	29,198	2,956	5,745	900	1,649	1,211	3,526	744	1,823	9,996	648

Source: 2015 American Samoa Household Income and Expenditures Survey

As noted, Tualauta is the largest county, being about 1/3rd of the total population in American Samoa in 2015. Maoputasi was about 1/6th of the total population, so the two of them made about half. As the pie chart shows, the other counties were much smaller. **Special Note: In some of the graphs presented here, the county of Saole is unintentionally misspelled Sa'aole. This note is not repeated throughout the text.**

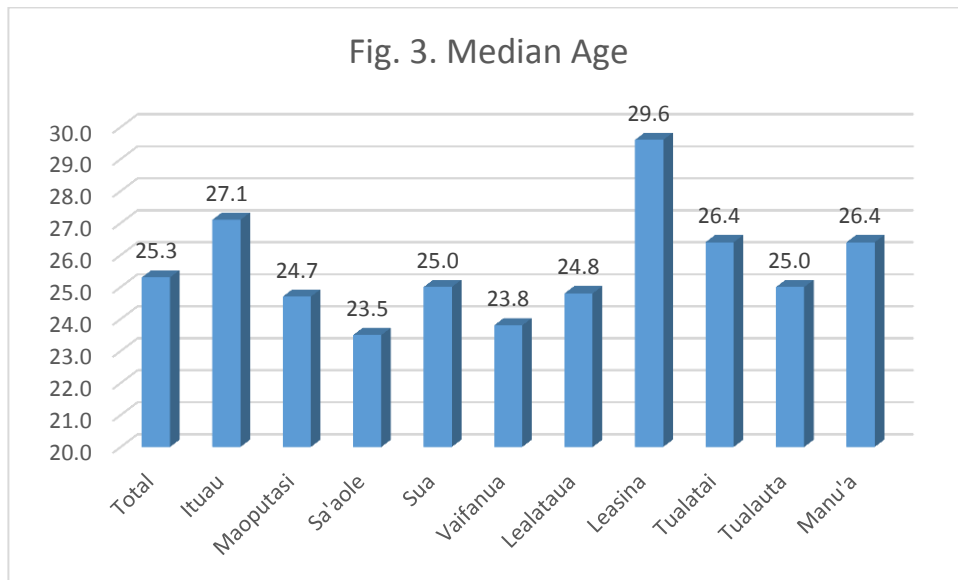

The chart below shows the relative total populations as well as the distribution by sex. As noted, American Samoa had more females than males, but they were not even distributed throughout the counties.

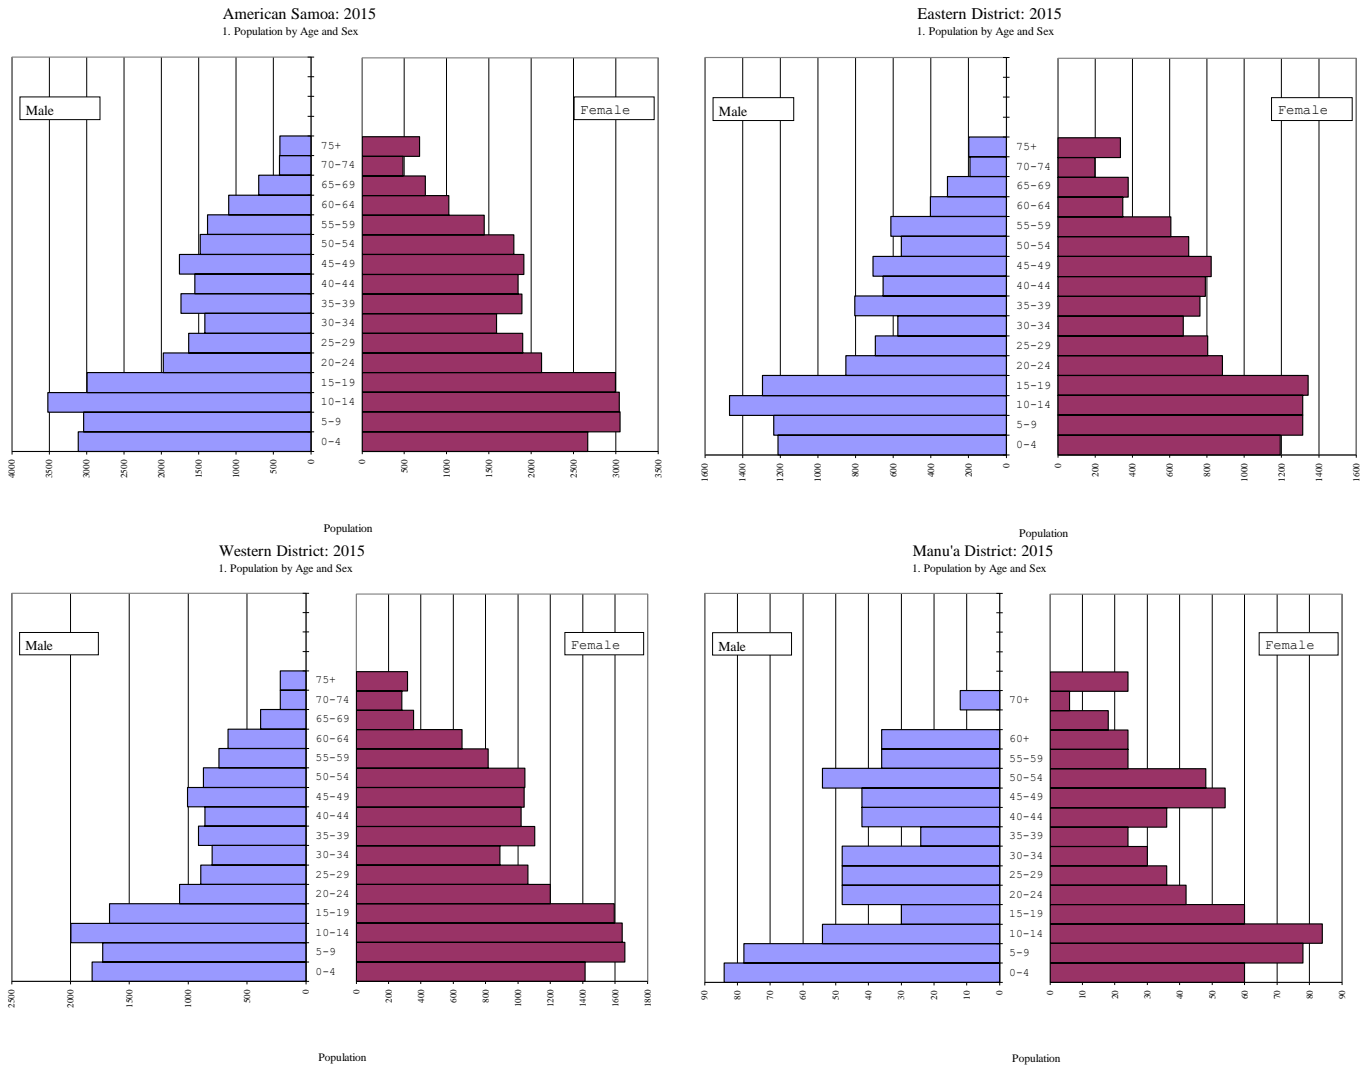

The median age is that age where half the people are older and half are younger. The median age in American Samoa in 2015 was 25.3 years, about 12 years younger than the United States median of 37.7

years. The median age was highest in Leasina at almost 30 years and was youngest in Saole at 23.5 years. The low median age in American Samoa reflects continued relatively high fertility and declining mortality.

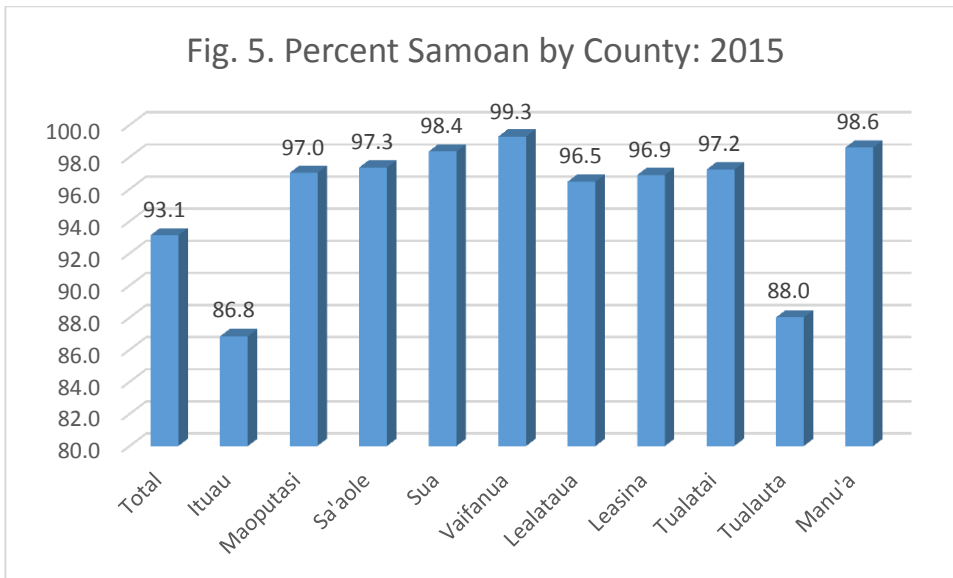

Population pyramids show the relationships of sex and age in one graphic. In the pyramids below for American Samoa and its Districts, we see the young population described by the median age somewhat more starkly. The pyramid for Manu'a is an anomaly because the total population is so small and has so few younger people because of migration for schooling and general migration for lack of economy. Pyramids in traditional countries and societies look like the pyramids of Egypt we see in pictures, with each higher age having fewer people than its younger adjacent age group. The American Samoa pyramids do not show the traditional pattern in several ways. There is bulge in the 10 to 19-year age groups shows reduced fertility in ages younger and emigration in ages a little older. Many American Samoans leave for the military or civilian work, and then return for retirement. As shown in the economics section, the economy is based almost entirely on the government and fisheries; many must leave for jobs and careers.

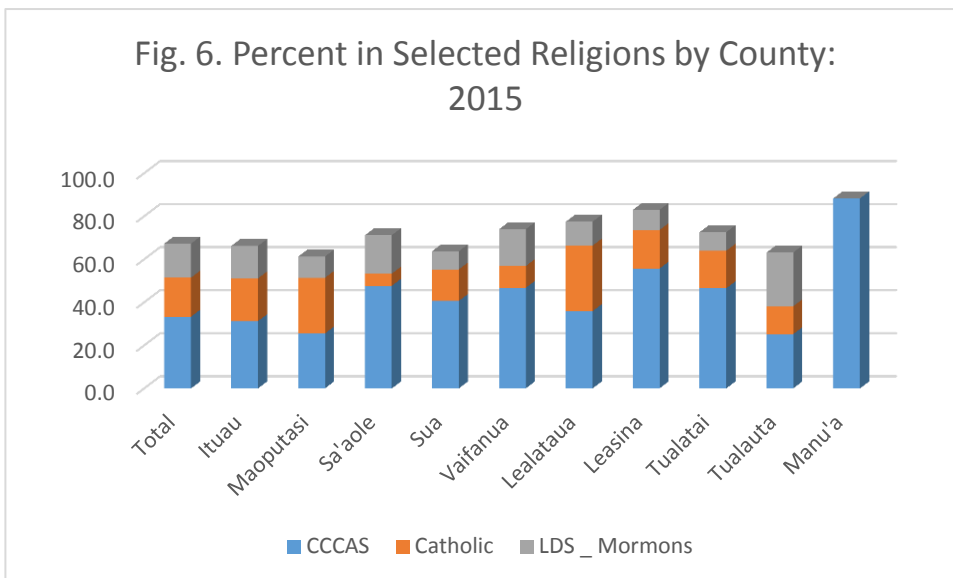

Fig. 4. Population Pyramids by District, American Samoa: 2015

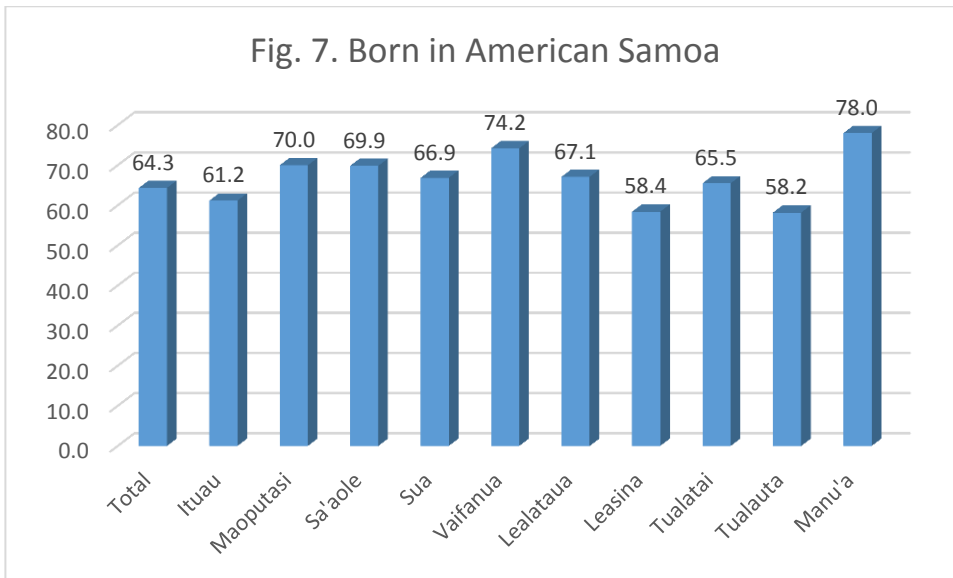

American Samoa is a very homogeneous entity based on ethnicity – almost the whole population, at 93 percent, is Samoan. About 99 percent of the populations of Vaifanua and Manu’a were Samoan in 2015, as were more than 97 percent of those in Maoputasi, Saole, Sua, and Tualatai counties. However, only 88 percent of Tualauta was Samoan and 87 percent of Ituau county. These counties had the largest numbers of foreigners – Mainland *papalagi*, Tongans, Asians, and others.

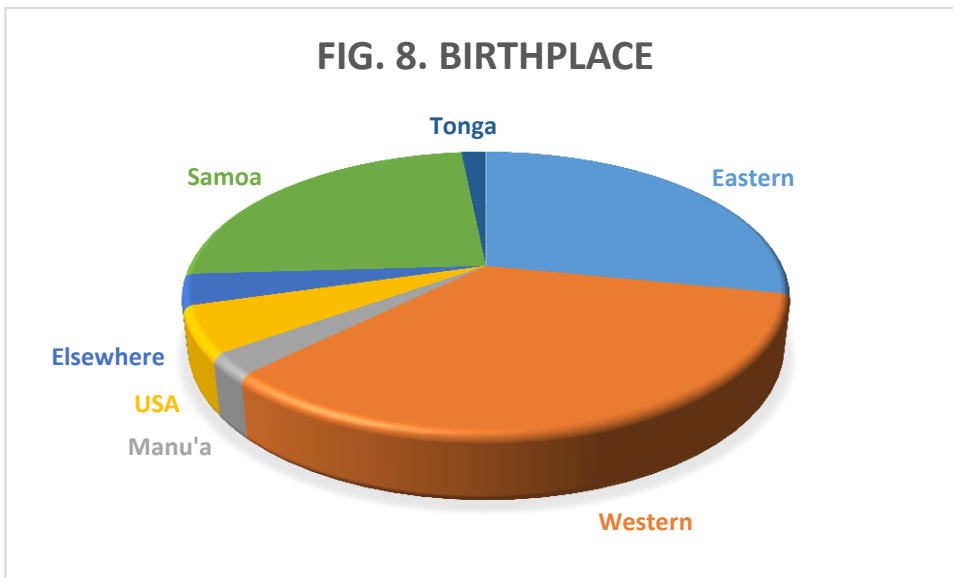

The survey used a write-in entry for religion. Of the written entries, the three largest groups were Congregational Christian Church of American Samoa (CCCAS), Roman Catholic, Church of Latter Day Saints (Mormons). Almost everyone in Manu'a was CCCAS, but the other counties showed more diversity.

About 2 out of 3 people living in American Samoa in 2015 were born there. The highest proportion appeared in Manu'a, more than 3 out of every 4 people living there. All counties had more than half the population born in American Samoa, but the results also show a very large amount of immigration. More than 1 out of every 3 people living in American Samoa were born someplace else.

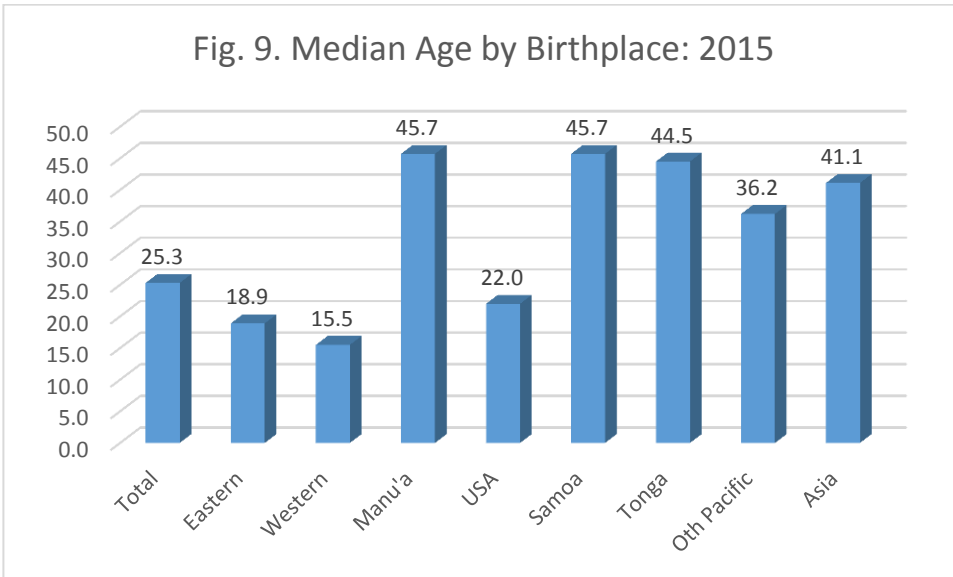

The largest percentage of the population was born in Western District, followed by Eastern District. Very few people were born in Manu'a because of its small population and lack of facilities. Samoa-born were also had a high percentage of those in American Samoa, but the territory had much smaller numbers born in Tonga, the United States, or other places. The two-thirds born in American Samoa are seen in the large parts of the pie.

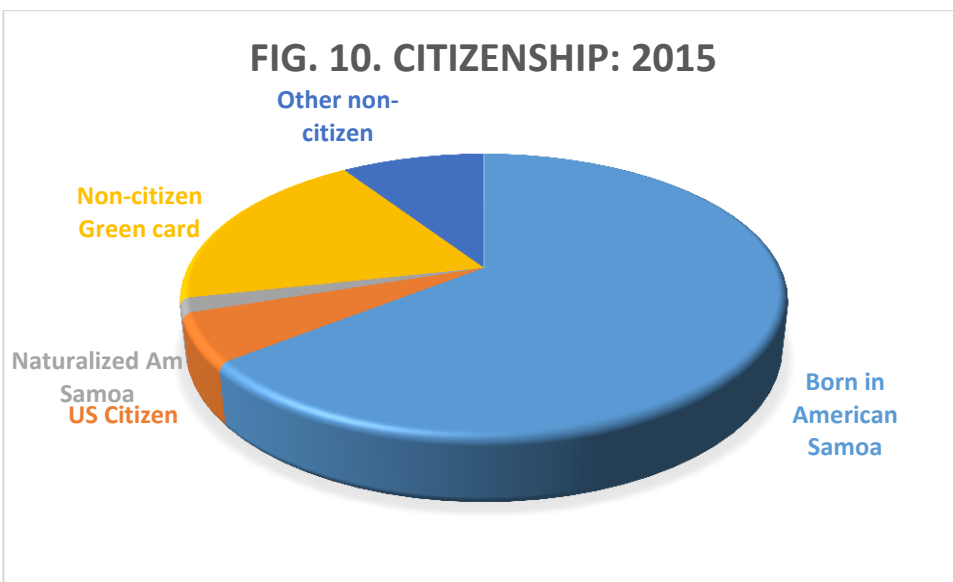

The median age of American Samoa's population in 2015 – that age where half the population was younger and half older – was 25.3 years. The places where many children were expected – Eastern and Western district – had much lower medians, about 19 for Eastern District and 15 for Western District. And, many American Samoans had children born in the U.S. while military or civilians and brought them back to the territory. On the other hand, the median age for Manu'a was almost 46, so mostly older people, with younger ones either on Tutuila for schooling or work or else out of American Samoa

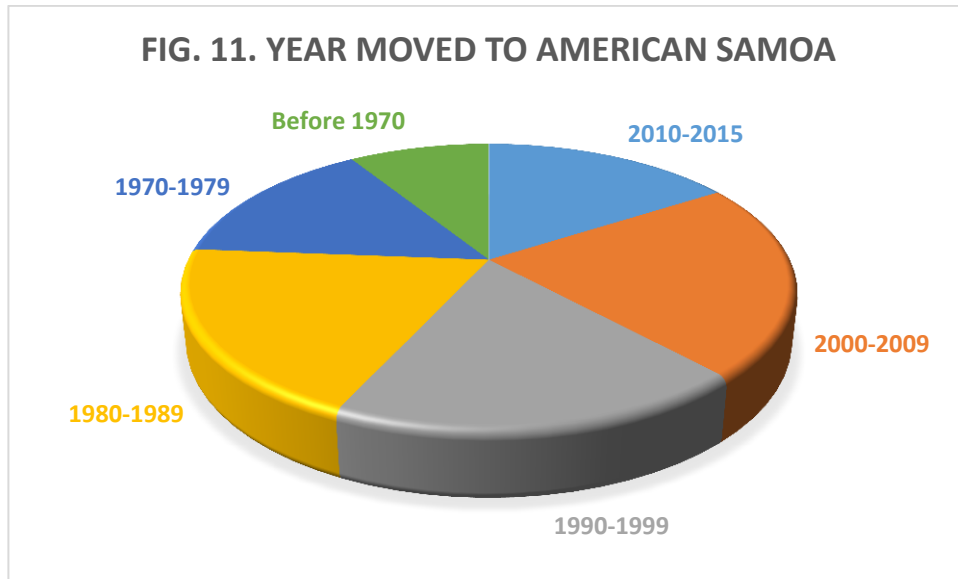

altogether. Also, all foreign groups had high median ages, from about 36 for other Pacific Islanders to almost 46 for those born in the nation of Samoa.

Discussion of citizenship in American Samoa is tricky because American Samoan born individuals are Nationals rather than citizens – American Samoans are the only population in this category. They carry National passports rather than Citizen but otherwise have similar rights to United States citizens. However, reporting for this item cannot always provide perfectly distinguishing results. The categories in the survey were: (1) born in American Samoa, (2) born in the U.S. or another U.S. territory, (3) born abroad of U.S. parents, (4) Naturalized American Samoa, (5) Non-citizen with a Green Card, and (6) other non-citizen. As discussed above, about 2 out of every 3 American Samoa residents were born in American Samoa. As can be seen in the pie chart, about 1 in 4 of the residents either had Green Cards or were not citizens (or Nationals) but living in American Samoa. The other, small groups were U.S. Citizens in one of the two categories or “Naturalized American Samoans” – an uncertain category.

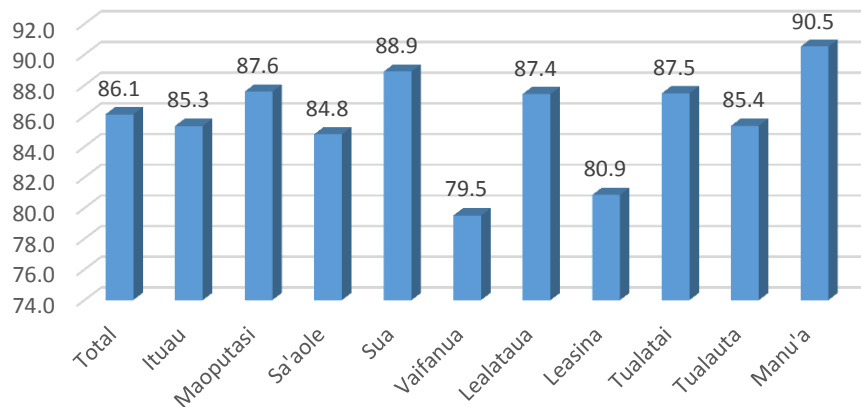

American Samoa has seen a relatively steady stream of immigrants over the decades. As the diagram shows, equal numbers came during the 1970s, 1980s, 1990s, and 2000s. And, it looks like that trend will continue for the rest of the current decade. Again, it is important to remember that about 2 out of every 3 residents were born in American Samoa, so we are only looking at the 1/3rd that came to American Samoa after being born elsewhere. However, some of this group were Samoans who had children in Hawaii or the U.S. Mainland, and brought them back to American Samoa.

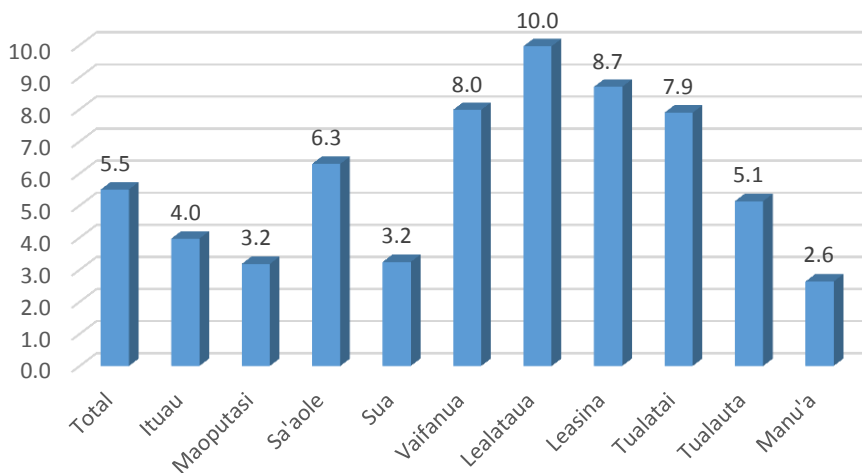

The items on birthplace provide information on “long-term” migration, that is, migration since birth. The item on residence in 2010, 5 years before the survey, shows short-term migration or recent migration. About 86 percent of the population 5 years and over lived in the same house in 2015 as they did in 2010; the population used is 5 years and over since younger people were not alive in 2010. About 9 of every 10 people in Manu’a lived in the same house in 2010 and 2015. Only about 8 in every 10 of those living in Vaifanua and Leasina counties lived in the same house in 2010 as 2015. So, when migrants did move to American Samoa from elsewhere and those living continuously in American Samoa, they only infrequently moved from house to another.

Fig. 12. In same house in 2010

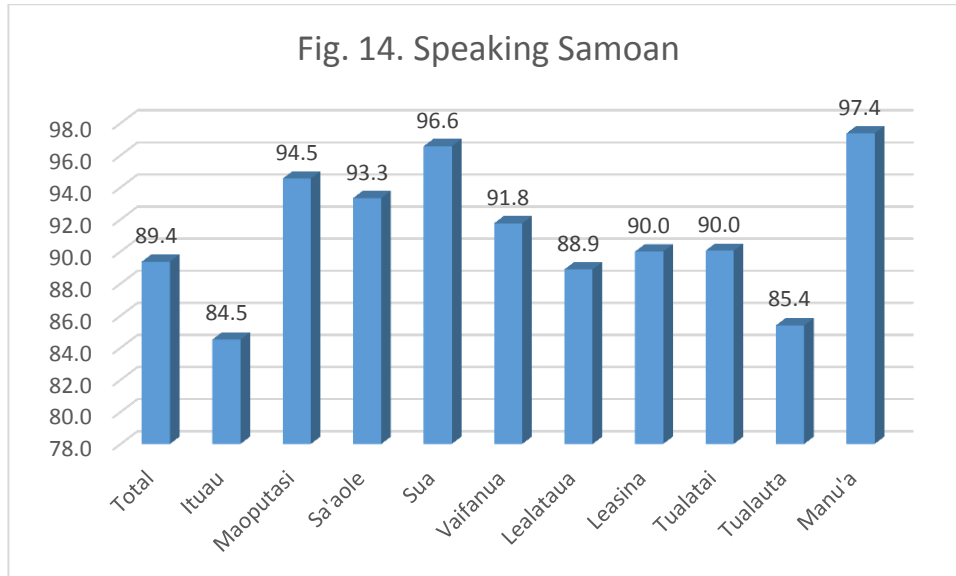

American Samoa became a U.S. territory in 1898, and has remained under U.S. control since then. Because it was basically independent before then, and because Samoan was the language as well as the ethnicity of the people living there, and because of the small number of migrants, and these migrants were not taking over as in Hawaii, the Samoan language remains strong and vibrant. Less than 6 percent of the population 5 years and older in 2015 spoke only English at home. Lealataua had the highest percentage of English only speakers, at 10 percent, Maoputasi, Sua, and Manu'a had the lowest percentages, at about 3 percent.

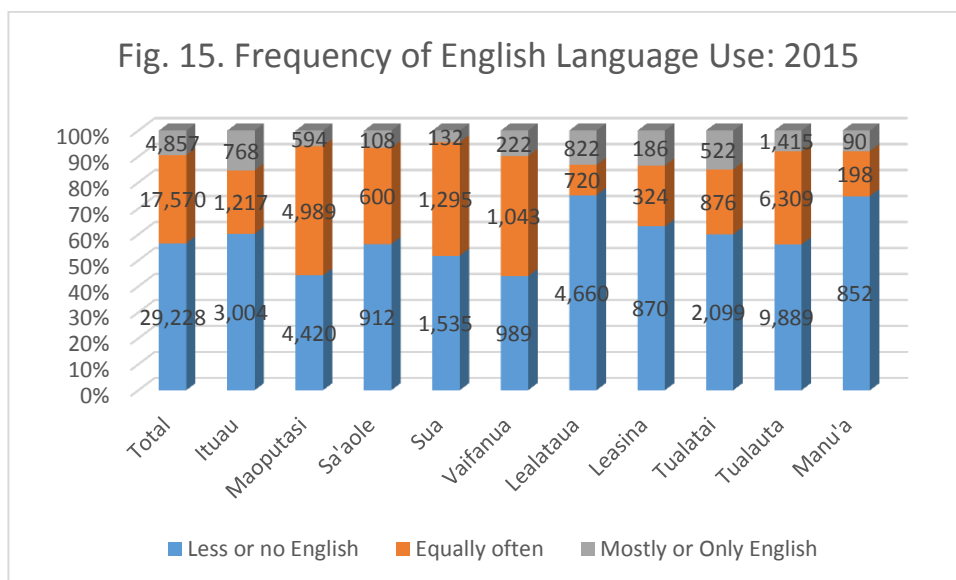

Fig. 13. Speaking only English

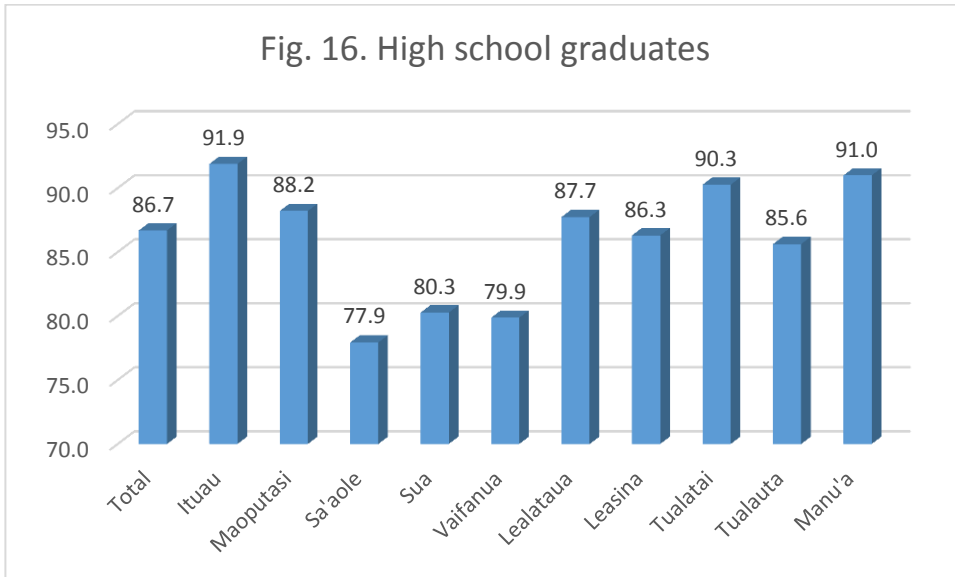

About 9 in every 10 of the people spoke Samoan at home. So, considering the 6 percent who spoke English at home, about 5 percent of the population spoke some other language at home. More than 97 percent of the Manu’a population spoke Samoan at home as did 97 percent of the Sua population. However, only about 85 percent of the populations of Ituau and Tualauta spoke Samoan at home.

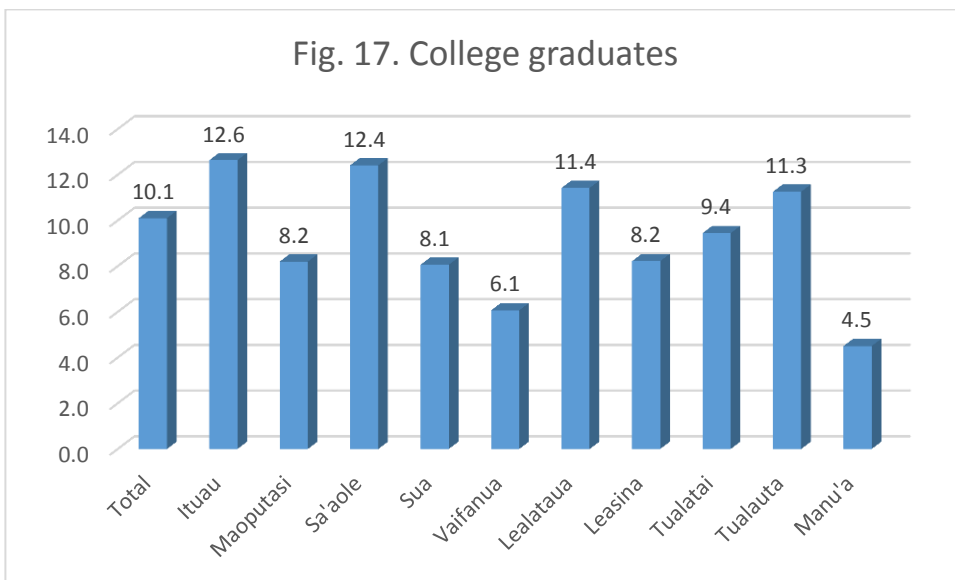

The survey also asked about the amount of English spoken compared to another language, which in most cases was Samoan. About half of the population 5 years and over spoke no English or spoke English less than the other language. About 4 in 10 spoke English and the other language equally often at home, while less than 1 in 10 spoke English more than the other language or spoke English only. So, Samoan continues to be the main language used in the home, and in the offices and in the private sector.

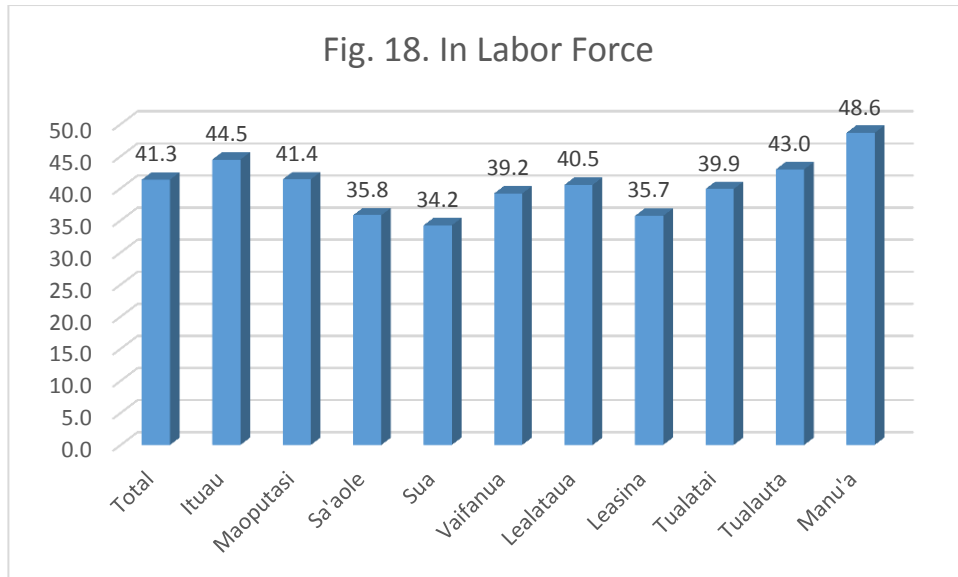

American Samoa has universal education, so all children at least start school. About 87 percent of the population 25 years and over – those who should have finished schooling – were high school graduates in 2015. Because of the number expatriate workers living in Ituau, their percentage being high school graduates was highest at 92 percent. Saole, Vaifanua, and Sua, had the lowest percentages being high school graduates, at 80 percent or less. A rate of 87 percent indicates that about 13 percent of the adult population did not finish high school.

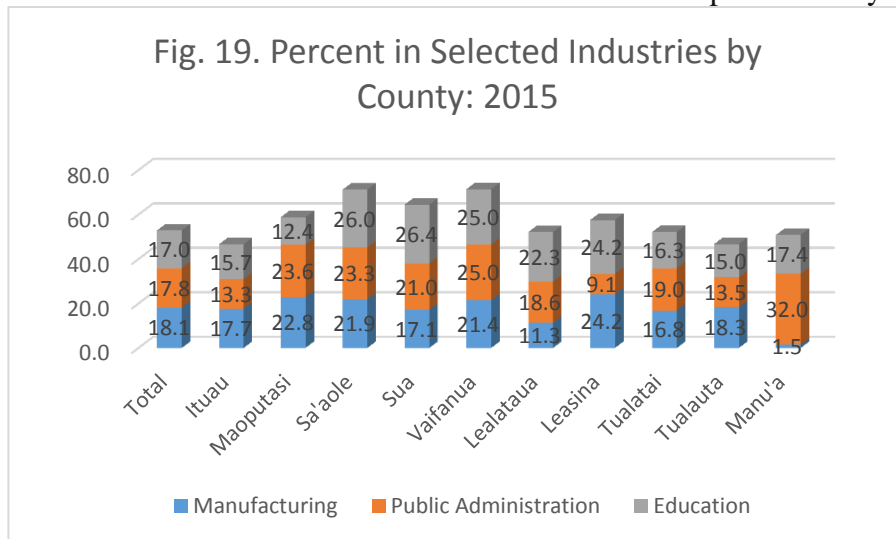

Approximately 10 percent of the American Samoa resident adults 25 years and older were college graduates in 2015. Ituau and Saole had the highest percentages at more than 12 percent, while less than 5 percent of the adults in Manu'a were college graduates. Of course, few jobs on Manu'a required a college education so many college educated Manu'a-born would have moved to Tutuila or out of American Samoa all together.

About 2 in every 5 of the resident American Samoa adults in 2015 were in the labor force, either working for pay, working for pay and doing subsistence, or just doing subsistence. Manu’a had the largest percentage in the work force, at almost 49 percent, and Sua had the lowest percentage, at just over 34 percent.

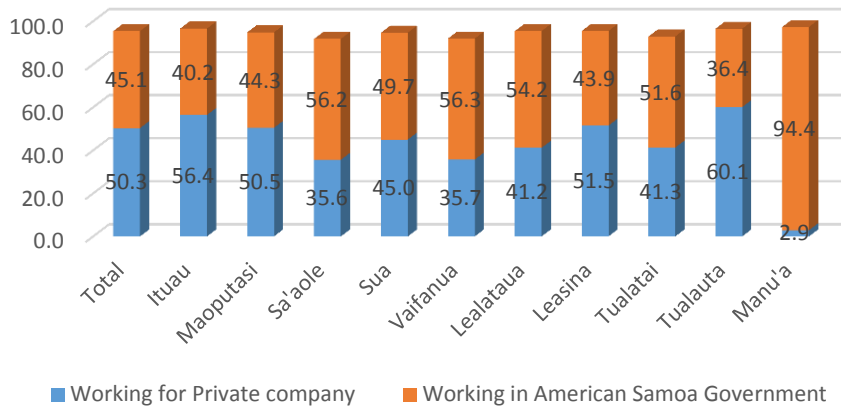

While the tables in the last section of this report show the major industries in American Samoa, the largest three industries were manufacturing, public administration, and education. About 18 percent of the adult population were working in manufacturing; almost all of them in the fisheries industries. But about the same numbers were working in public administration as well as in education. The three groups made up about half of all workers. Saole and Vaifanua counties had the largest number of these workers, about 70 percent each of all the workers living in those countries. About 1 in 3 of workers in Manu’a were in public administration as expected, since Manu’a basically had no access to manufacturing. About 1 in 4 of the workers living in Saole, Vaifanua, and Sua were in education, and about 1 in 4 of the workers in those counties and Maopatasi county were in public administration.

Although some workers were self-employed or working at no pay in a family enterprise, more than 95 percent of the workers either worked in the private sector for employers or worked in the American Samoa government. Of those, about half of all workers were in the private sector, while somewhat less than half worked for the American Samoa government. Almost all workers in Manu’a worked for the government. About 6 in 10 of the Tualauta adults worked in the private sector, as did about 56 percent of Ituau adults, and about half of those living in Maoputasi and Leasina counties. In all other counties, larger percentages worked in the government. In fact, only about 1 in 3 of the workers in Saole and Vaifanua counties worked in the private sector.

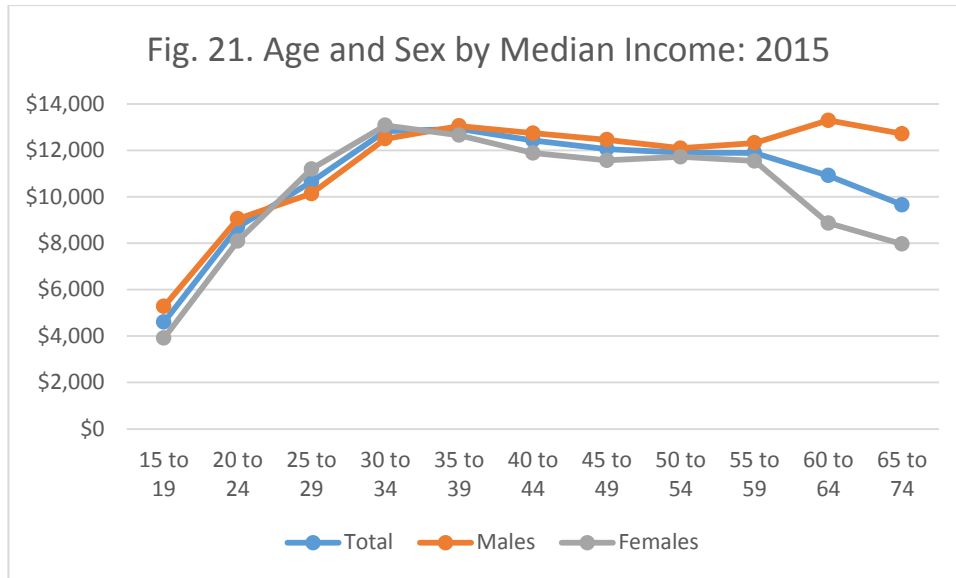

Fig. 20. Percent in Public and Private Sectors by County: 2015

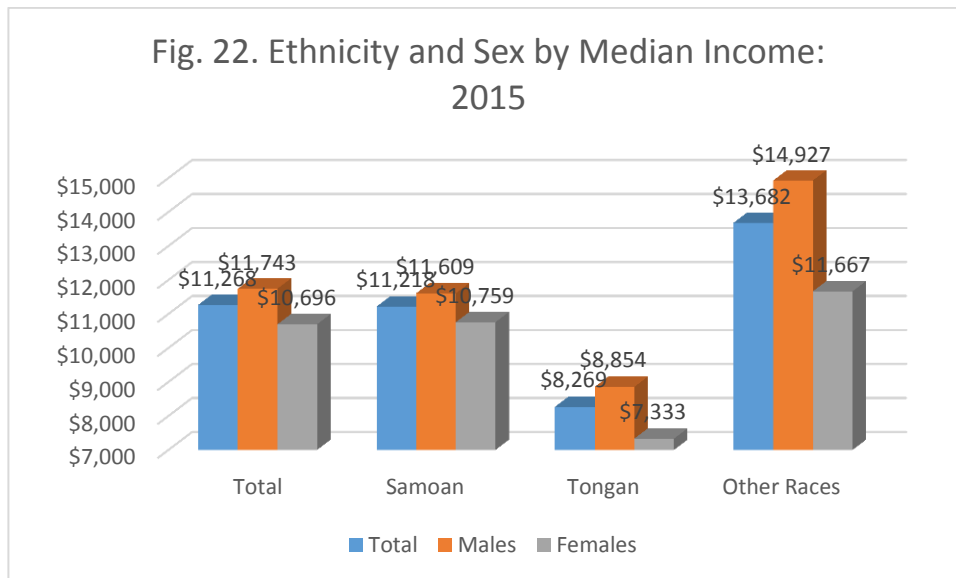

The 2015 American Samoa Household Income and Expenditures Survey is the only instrument in the decade that collects information on both income and expenditures. Income is also collected in the Decennial Censuses, so information from the 2010 American Samoa Census is also available. The tables in the last section contain crosstabulations for income by the various other population variables. Two sets of tables appear – the first includes all persons, including those with no income, and the second set includes only those with some income in 2014. The calendar year 2014 is used to obtain information for a whole year, and should be fairly accurate because the data were collected near the time when residents would be filing their taxes.

As expected, young people make lower annual incomes than older people. But, we don’t see the normal distribution by sex – females and males younger than 60 made about the same incomes. However, the few males 60 years and older did make higher incomes than females in these age groups. When the median above \$12,000 was reached about age 30, it remained there, decreasing only slightly with age. That is, the normal situation where older individuals, because of length of service and experience, who should have been making significantly higher incomes than younger people were not.

A median of \$12,000 indicates an average hourly wage based on a work year of 2,000 hours of about \$6 an hour. Since the minimum wage in the United States is now \$7.25 an hour, the average wage in American Samoa is less than the minimum wage in Hawaii and the U.S. Mainland.

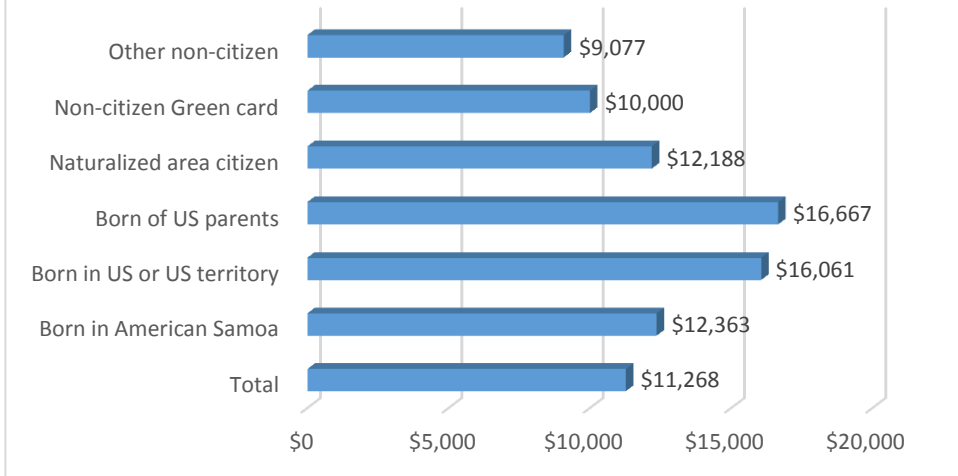

Because so many of American Samoa’s population was Samoan, the distribution of Samoan incomes pretty matched the incomes of the total population, with females making about \$1000 less annually than the males. Tongans made about \$3,000 less annually, “other races” made significantly more – about \$2,500 total, with other race males making about \$3,000 more than average.

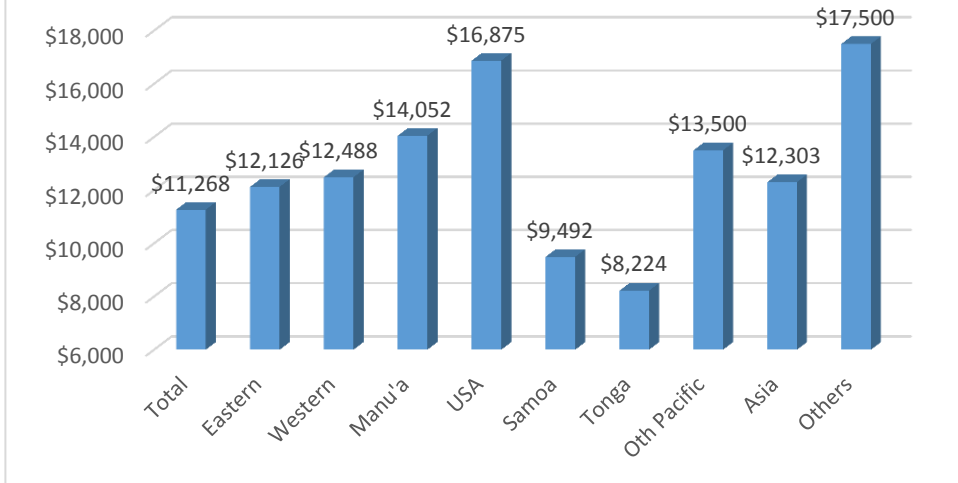

American Samoa residents born in American Samoa made about \$23,400 in 2014, about \$1,000 more than the median income for the whole working population. U.S. Citizens made about \$5,000 more than average, partly because many were in jobs requiring specialized training and experience. Naturalized American Samoans made about the same as those born in American Samoa, but foreigners made significantly less – about \$10,000 annually for Green card holders and about \$9,077 for other non-citizens.

Fig. 23. Citizenship by Median Income: 2015

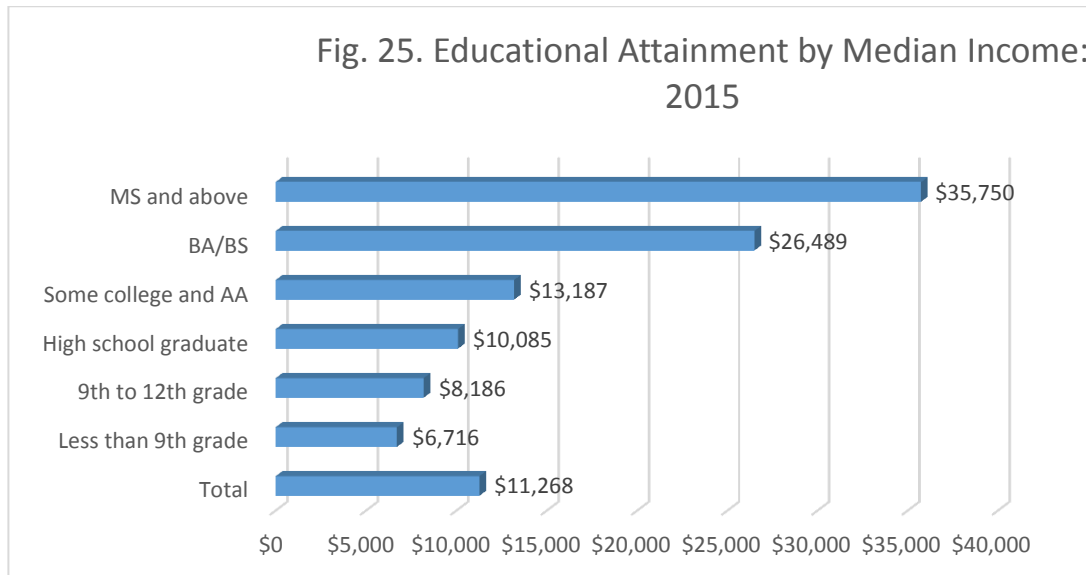

Workers born in the United States made the highest incomes, at almost \$17,000 (about \$8.50 an hour) of the selected birthplaces – “other places” was slightly higher. Those born in American Samoa made higher than average wages, with Manu’a especially, at \$14,000 being about \$3,000 higher than the territory average. Those born in Samoa, however, made only \$9,500, more than \$1,500 less than average, and Tongans did even worse, at about \$8,200 – fully \$3,000 less than the American Samoa average, and about \$4 an hour. Other Pacific Islanders and Asians made more than the average. All median incomes were low by U.S. standards.

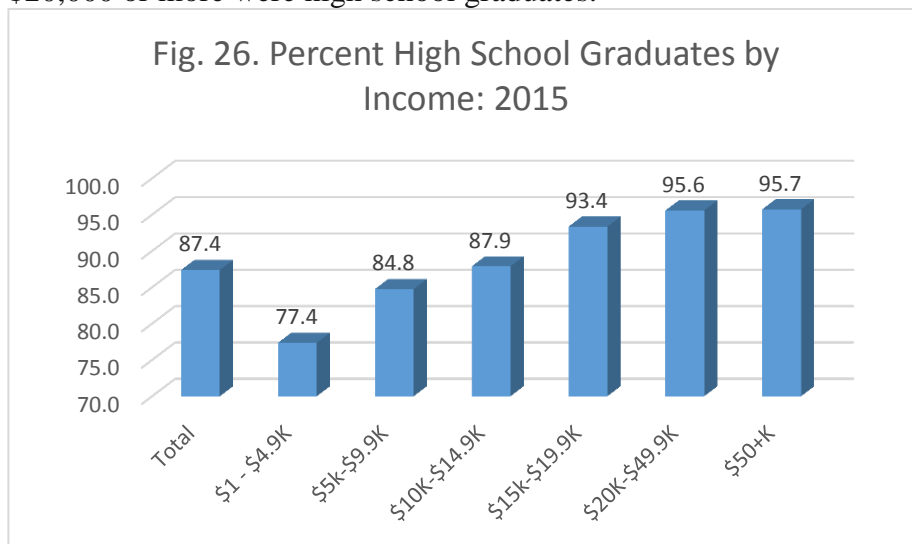

Fig. 24. Birthplace by Median Income: 2015

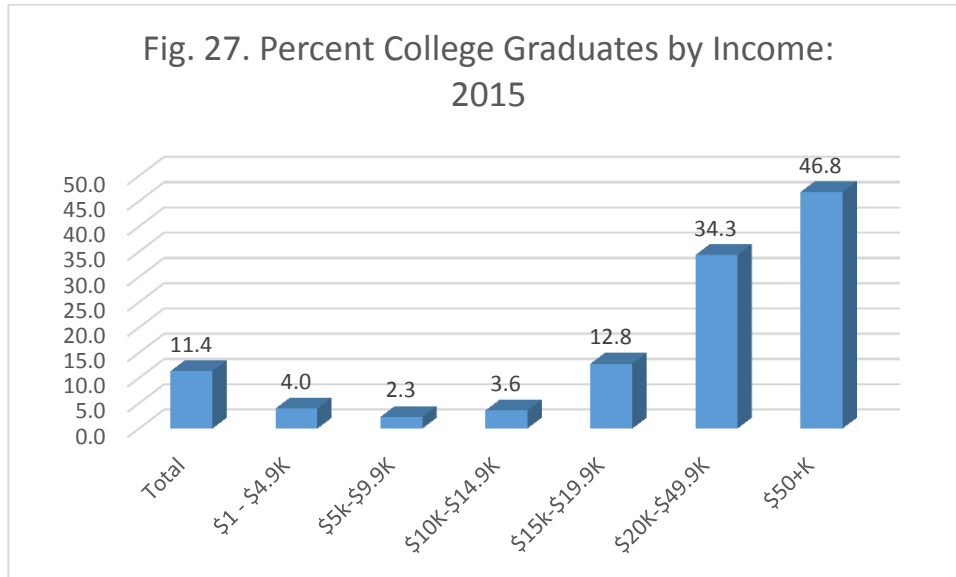

As expected, education made a difference in median incomes. In fact, a direct relationship existed between education and income – the higher the education, the higher the median income on average. So, while those finishing less than the 9th grade made less than \$7,000 annually (\$3.50 an hour), high school graduates made about \$10,000 (\$5 an hour), those with a Bachelor’s degree made about \$26,500 annually (\$13.25 an hour), and those few with a Master’s Degree or greater made about \$36,000 annual (about \$18 an hour). It is important to note, as earlier, that very few American Samoa residents had higher degrees, so most of those who did were doing highly skilled work requiring lengthy educations and experience.

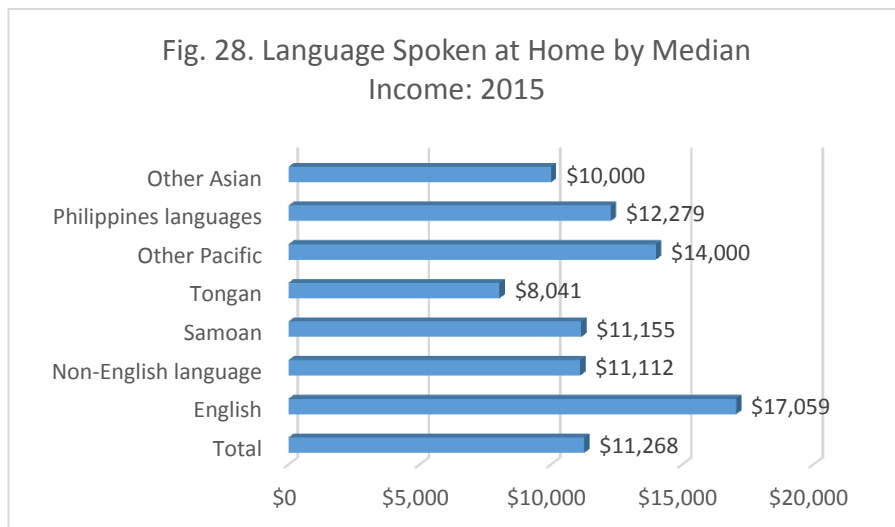

Also, as expected, the higher the income, the higher percentage of high school graduates. While about 87 percent of the American Samoa population 25 years and over were high school graduates, this was true for only about 77 percent of those making less than \$5,000 a year. The percentage being high school graduates increased consistently with increased income, so that about 96 percent of those making \$20,000 or more were high school graduates.

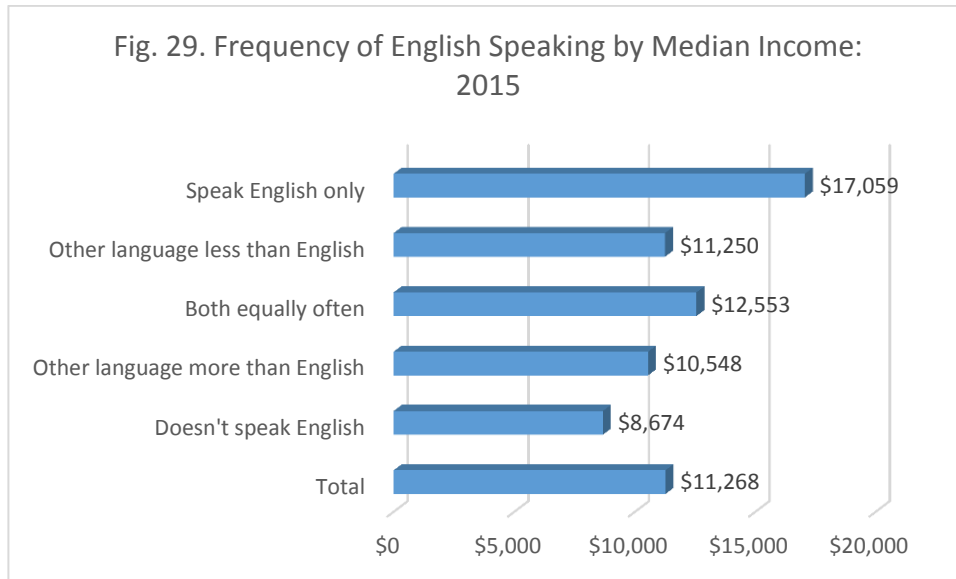

Similarly, while about 11 percent of the adult population in American Samoa in 2015 were college graduates, only 4 percent of those making less than \$5,000 were in this category. And the percentage was even lower for those making between \$5,000 and \$15,000. However, more than 1 in 3 of those making \$20,000 to \$50,000 were college graduates, as were almost half of those making \$50,000 or more. The moral is that education counts! The more education a person gets, the higher their annual income, on average.

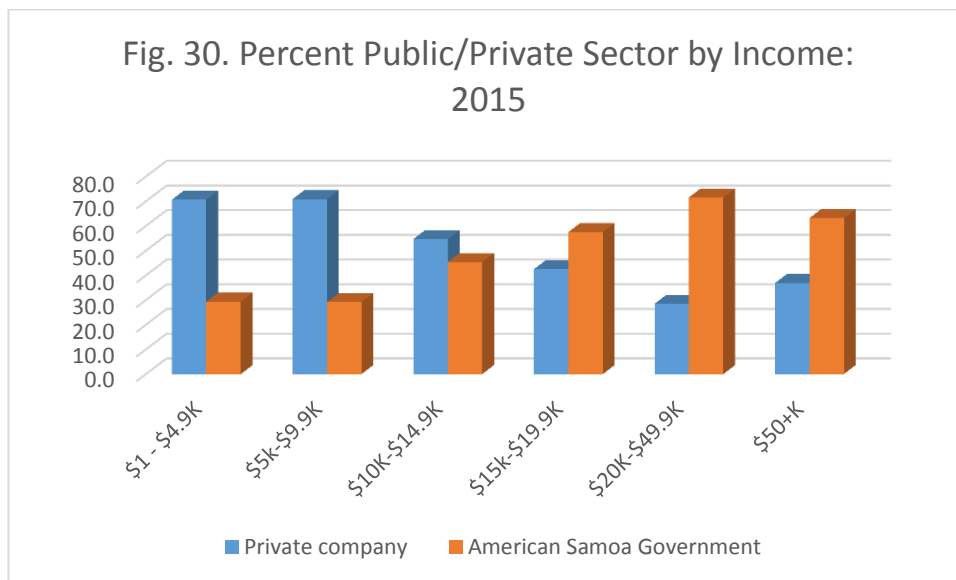

Besides higher education, speaking English at home also helps. On average, adults speaking English at home made about \$5,000 a year more on average, at about \$17,000 a year, or \$8.50 an hour. Those speaking Philippines languages made about \$1,000 more per year on average, about \$2,000 less than the “other Pacific Islanders” – a very small group of highly skilled Fijians, Australians, and New Zealanders. Samoans made about the same as the total, as expected, while Tongan speakers made about \$3,000 less, and so similar to Tongan ethnicity.

As noted, adults who spoke only English at home averaged about \$17,000 annually. At the other end of the spectrum, those adults in American Samoa who spoke no English averaged only \$8,700, only half as much as the English only speakers. Those who spoke both equally often earned about \$1,000 more than all workers, while those who spoke more OR less than English, made less than average. Hence, a relationship between English speaking ability and income appears to have existed.

As noted earlier, approximately equal numbers of people worked in the public (Government) and private sectors in 2015. The graphic shows the percentages working in those sectors for increasing income categories. While about 30 percent of the workers making less than \$5,000 annually were in the public sector, that increased to about 70 percent for those earning \$20,000 or more. So, the reverse was true for those working in the private sector.

This section has provided a brief overview of information derived from the population part of the 2015 American Samoa Household Income and Expenditures Survey. The tables in the last section provide much more detail for use by the public and private sectors in planning and policy formation.

10.2. HOUSING CHARACTERISTICS

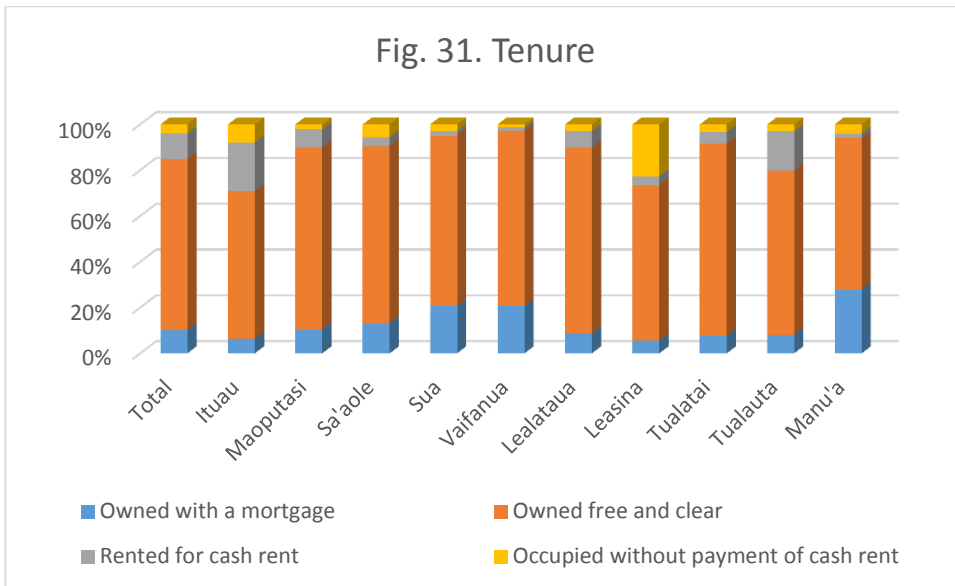

This section looks at housing data from the 2015 American Samoa Household Income and Expenditures Survey. As noted in the first section of this report, weights were applied to the enumerated units to obtain the estimated numbers of units in American Samoa. The survey estimated about 11,000 units in the whole territory as shown in the table below. Tualauta was the largest county with about 3,800 housing units, followed by Maoputasi with 2,200 units. The five counties of Manu'a only constituted 300 units by the time of the 2015 household survey.

Table B. Selected Housing Characteristics, American Samoa: 2015

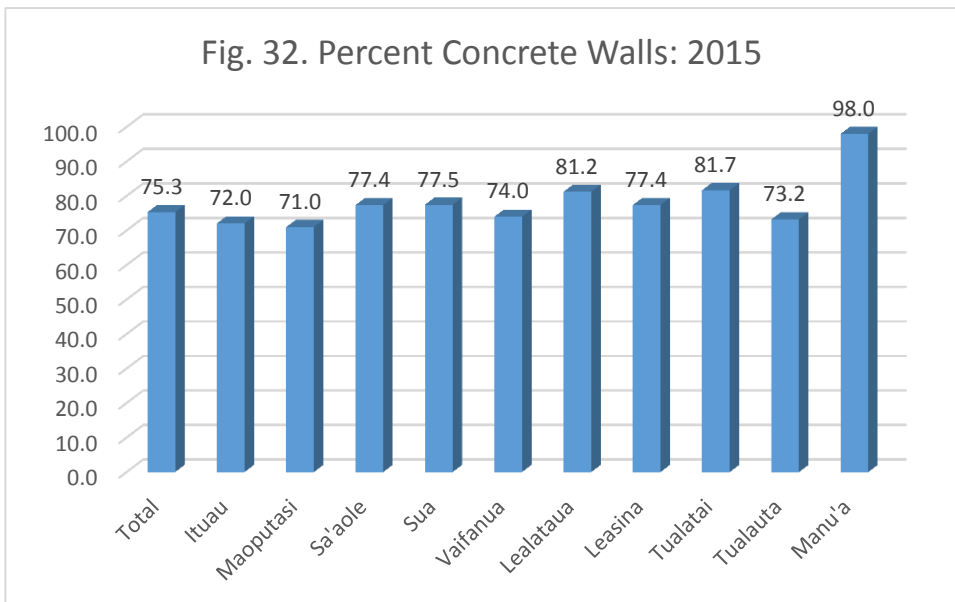

Housing Characteristics	Total	Ituau	Maoputasi	Saole	Sua	Vaifanua	Lealataua	Leasina	Tualaitai	Tualauta	Manu'a
Housing	11,034	1,133	2,171	318	612	438	1,241	318	720	3,784	300
Tenure:

Source: 2015 American Samoa Household Income and Expenditures Survey

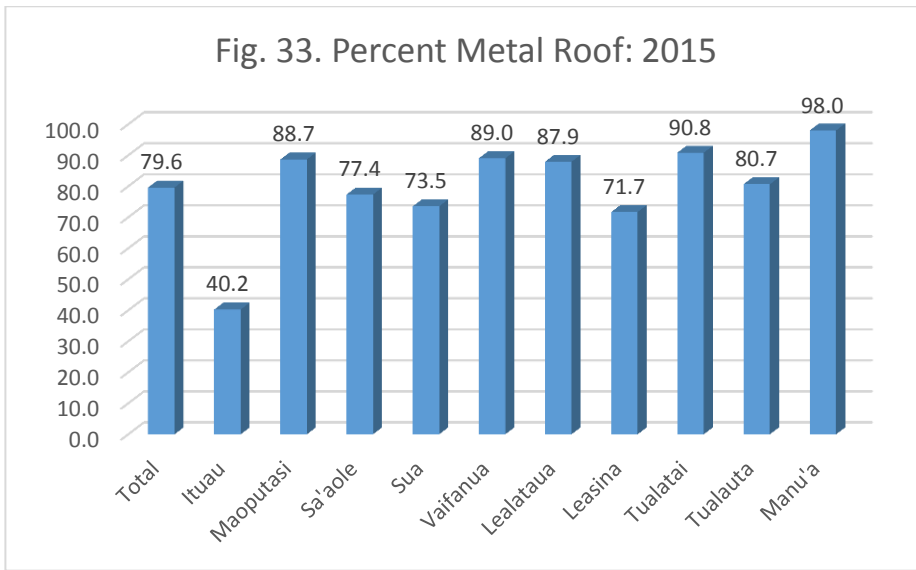

Because some people build on communal land without getting a mortgage, assessing the exact meaning of Western-style house tenure is more difficult. Only a small percent of the housing units in American Samoa were “owned with a mortgage”, with the largest percentage being in Manu’a. Most of the units were owned “free and clear”, meaning that these units either never were mortgaged, or the mortgage had been paid off. Very few units were rented, and very few units were inhabited without being either owned or rented. While more of this last type of unit seems to have occurred in Leasina, it could also be that these units should have been collected as “owned free and clear”.

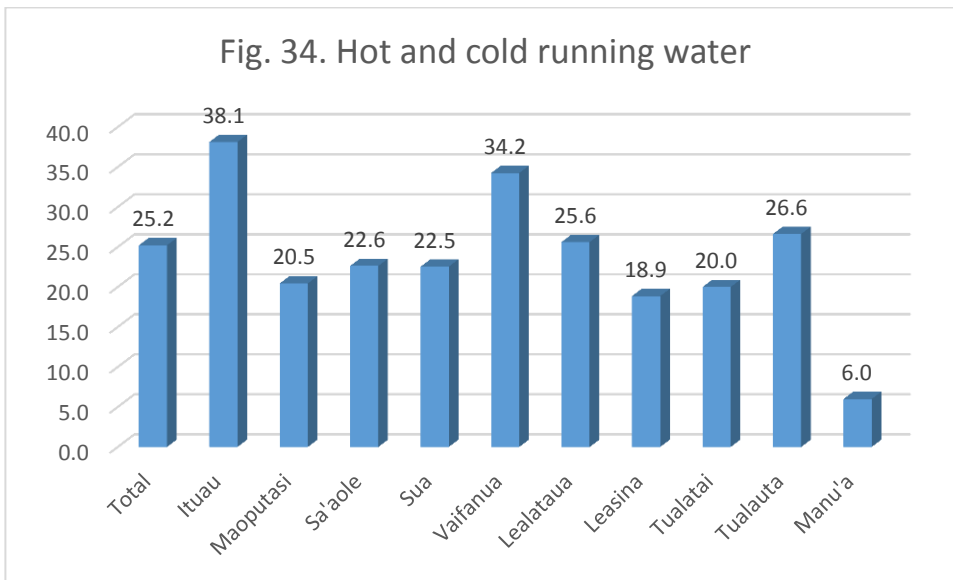

About 3 in every 4 housing units in American Samoa had concrete walls. Many of the concrete walls were built after recent hurricanes and other natural disasters. Almost all counties had about the same proportions of concrete – either as blocks or solid – walls. But in Manu’a almost all walls were made of concrete.

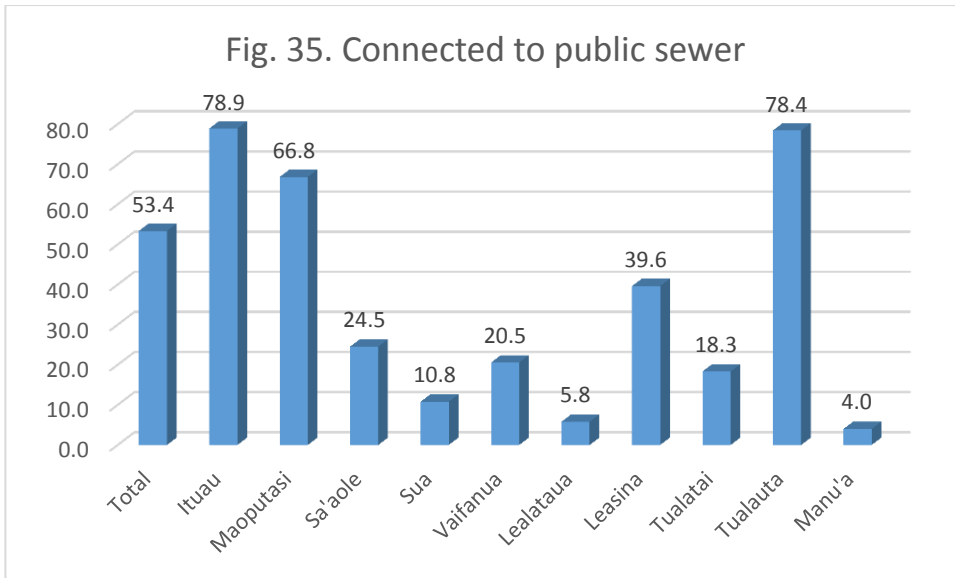

Similarly, most of the units still had metal roofs, even knowing about infrequent hurricanes. About 4 in every 5 of the housing units in American Samoa in 2015 had metal roofs. Almost all roofs in Manu’a were made of metal. But only 2 in every 5 of the roofs in Ituau county were metal. More than 7 in 10 of units in the other counties had metal roofs.

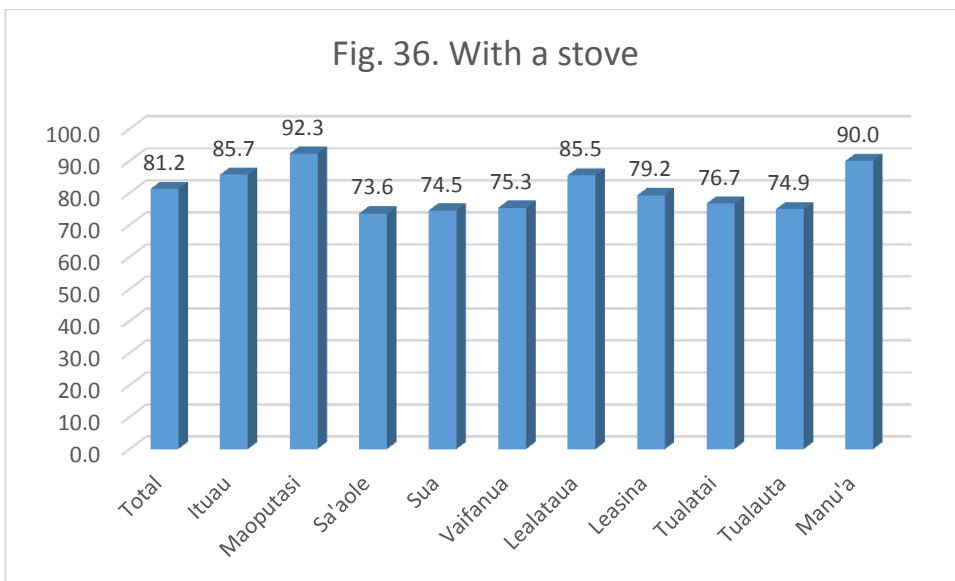

Only 1 in every 4 of the American Samoa housing units in 2015 had hot and cold running water. Because American Samoa has such high temperatures, hot water is not needed for bathing, but it is useful for cooking. Only 6 percent of the units in Manu’a had hot and cold running water, but more than 1 in 3 of the units in Ituau and Vaifanua fell in this category. About 1 in 4 of the units in Tualauta and Lealataua had hot and cold water, decreasing to about 1 in 5 in most of the other counties. Again, while hot and cold water are not needed in American Samoa, having access shows a certain level of technological presence.

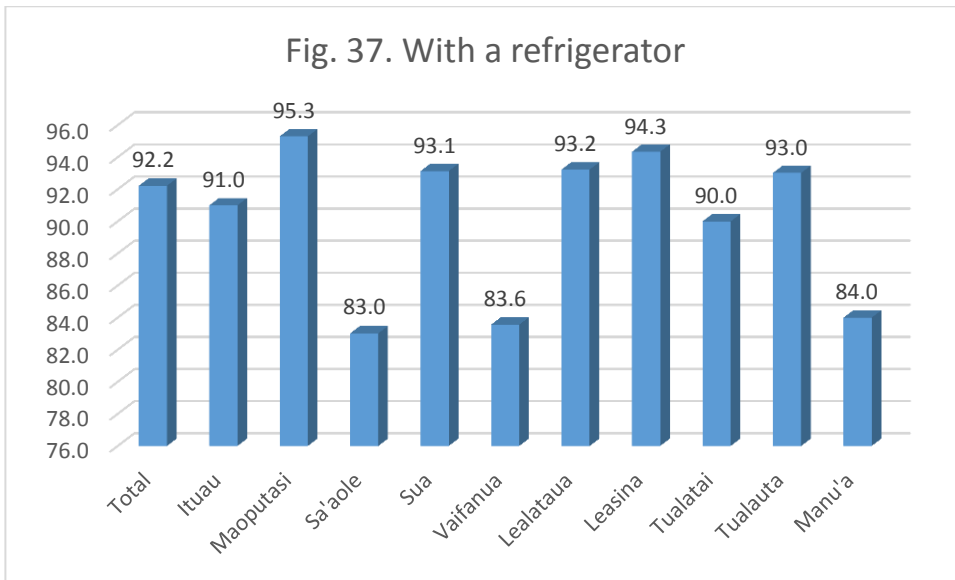

Only about half the housing units in American Samoa are connected to a public sewer. More than 2 out of every 3 units in Ituau and Tualauta are connected but that is offset by the very low percentages in Manu’a (4 percent) and Lealataua (6 percent) – even these values may be high because of data collection and imputation procedures. About 2 out of 3 units in Maoputasi county and 2 of 5 in Leasina County were connected, but all others were less than 1 in 4 units.

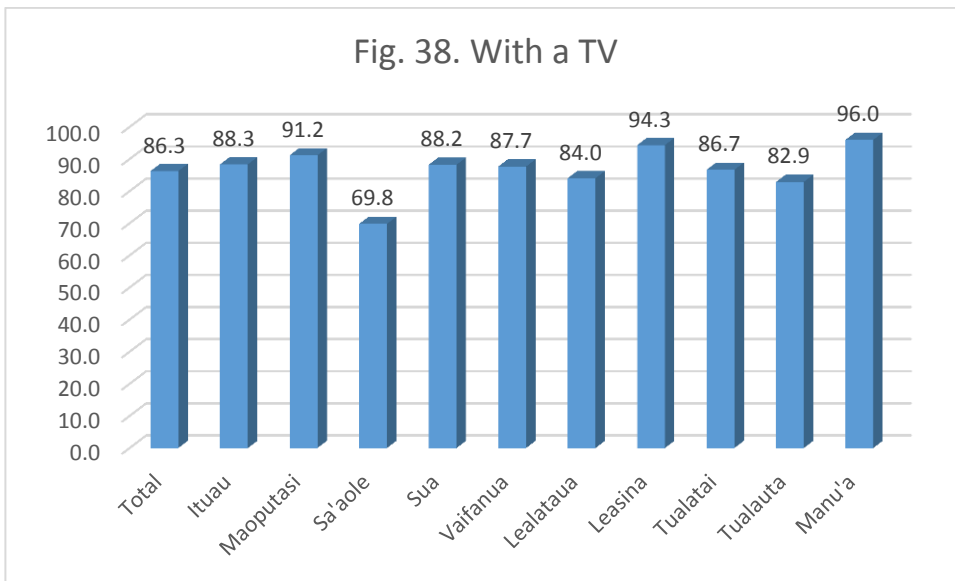

About 1 in 5 of the American Samoa units in 2015 still did not have a stove. About 9 in every 10 of the units in Maoputasi and Manu'a had a stove, but only about 3 in 4 of the units in most of the counties had a stove. Not having a stove requires more work and less efficiency in producing food for the table.

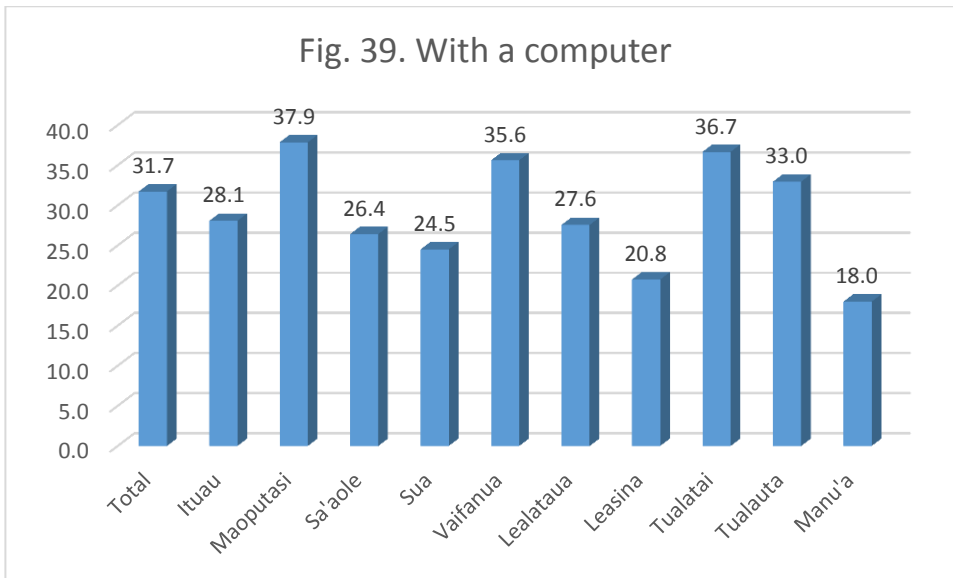

We would expect that currently most people would have a refrigerator so that they would not have to go frequently to a store to get food that would perish otherwise. And, more than 9 in every 10 of the housing units in American Samoa in 2015 did have a refrigerator. But, this was true for only 83 percent of the Saole units, and 84 percent of those in Vaifanua and Manu'a.

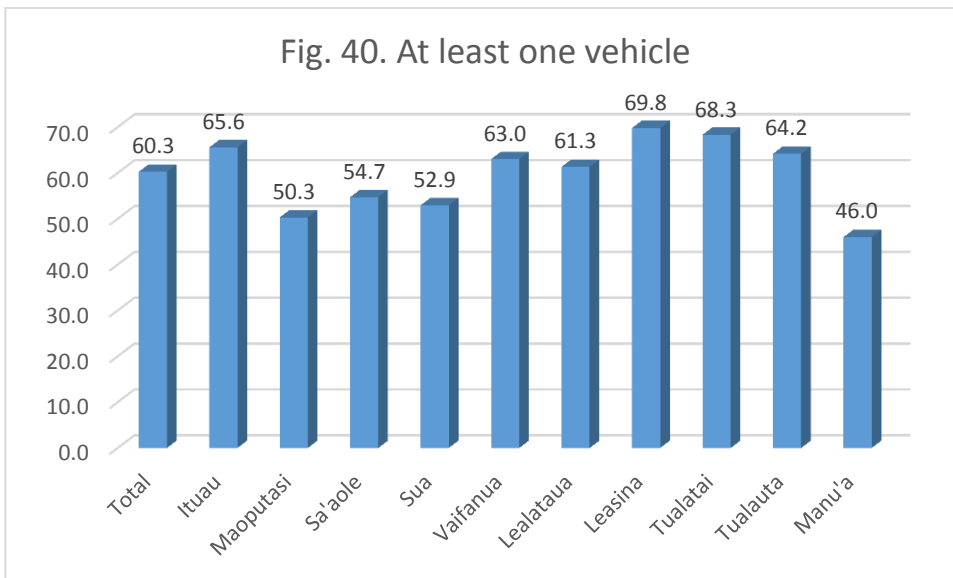

About 86 percent of the housing units had a television, so television reception was pretty much universal. Manu'a had the highest percentage, at 96 percent, while only about 7 in 10 of those in Saole had a TV, probably because of problems in reception. The pervasive use of television provides entertainment, but also can be crucial before storms and other potential disruptions.

Less than 1 in 3 of the housing units had a computer in 2015. The percentage was lowest in Manu'a, at about 18 percent, and was highest in Maoputasi at 38 percent and Tualatai at 37 percent. The numbers are low considering the importance of changes in media transfer these days. Many people now only get their news from the internet these days, including sources of social media. Nonetheless, schools and other sources of the internet are also available in American Samoa.

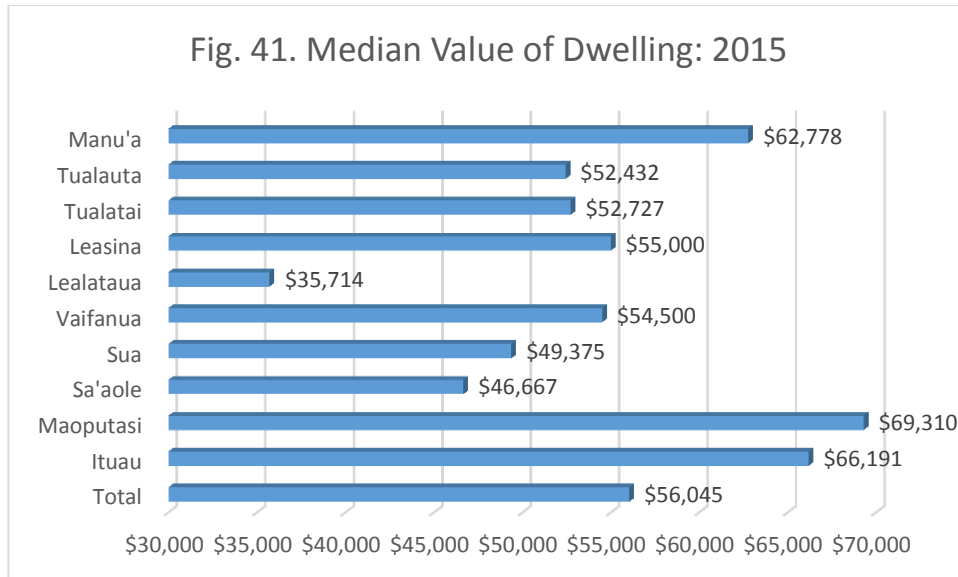

About 3 in every 4 housing units in American Samoa has at least one vehicle – sedan or truck or SVU. So, about 2 in 5 units did not have a vehicle, and had to rely on others or public transportation (via *aiga* busses or other public vehicles.) Almost 7 in 10 of the units in Leasina had at least one vehicle compared to less than half of the vehicles in Manu’a, where residents did not have far to go in most cases.

Even though almost everyone in American Samoa lives in single-family unattached housing units, estimating the value of the house is very difficult because families do not sell their houses. Nonetheless, because this is an income and expenditures survey, it is useful to get an estimate of the value of a house for those either having a mortgage or having paid off a mortgage (or just built the house on the land where they are living.) According to the survey, the average housing unit in American Samoa in 2015 was worth about \$56,000. The average value in Maoputasi was highest at

more than \$69,000, and the average value was lowest in Lealataua at about \$36,000. All values are low compared to values on the U.S. Mainland, and, of course, even more so in Hawaii, but structures are less complicated, particularly when heating is never needed, and most units do not have air conditioning either. Also, as noted, since the units are not sold, estimating the value is very difficult.

The population and housing items were similar to the items in the 2010 American Samoa census, earlier censuses, and the 1995 and 2005 Household Income and Expenditures Survey. Hence, another report could show trends analysis. The 2015 survey results are the most recent ones, and so should be used for planning and policy formation, but it is also useful to look at trends over time. The population items show current information for age, sex ratios, migration, education, and economic characteristics. The housing data show current housing structure and facilities.

10.3. EXPENDITURES

This last section of the main report briefly covers annual, regular and diary expenditures. Brian Hannon, the economist who is developing the market basket for the new Consumer Price Index, will be discussing the expenditures in more detail in his report. However, here we present some of the data on expenditures collected in the survey.

Some expenditures items appeared on the housing record because that was the most appropriate place to collect them. Not all 1840 households in the survey reported all items. For example, the 205 households reporting they paid rent, also reporting paying about \$106,000 total, or an average monthly payment of about \$519 per unit for those reporting rent. The last column divides the total amount of rent paid by all units in the sample, and so that figure was \$59, which is the figure used in determining whether the item will be in the market basket, and if it is, its weight.

Most units paid telephone bills, so the difference between those reporting paying the bill (at \$71 per month) was not very different from the all-sample number of \$68. Most of the housing items requiring amounts paid followed whether the household was likely to have the utility. For example, since many units did not have the internet, the numbers paying for the internet were much lower than those for water and waste disposal. The biggest expense was for those 22 units having home insurance, at an average of \$613, followed by those with home mortgages at \$533.

Table E01. Housing Expenses, American Samoa: 2015

Item	Total Hshlds Responding	Total Expenditures	Average Monthly	
			Sample Units	All units
Monthly Rent	205	\$106,365	\$518.85	\$58.96
Telephone Exp	1,746	\$122,990	\$70.44	\$68.18

Home Insurance	22	\$13,488	\$613.09	\$7.48
Mortgage	169	\$90,111	\$533.20	\$49.95

Source: 2015 American Samoa Household Income and Expenditures Survey

After that, the expenditures were divided into two parts – (1) regular and annual expenditures and (2) weekly expenses collected in the diaries. The regular and annual expenditures appeared in the same questionnaire as the population and housing items, but the daily diary items were collected in a booklet provided to the housing unit to be filled in for a calendar week.

The regular expenditures were divided into many sections. We are not including all responses here, but do cover most of them. For example, table E02 shows various furniture purchases in the survey period. The survey had 1,547 purchases of Bedroom Furniture at a total cost of about \$1.3 million, or about \$842 per purchase. Living Room Furniture and Other Furniture followed with over a million dollars worth of purchases.

Table E02. Furniture Purchases by District, American Samoa: 2015

Furniture Purchases	County				County				County			
	Total	Eastern	Western	Manu'a	Total	Eastern	Western	Manu'a	Total	Eastern	Western	Manu'a
Bedroom furniture	1,547	738	786	24	\$1,303,325	\$587,706	\$659,252	\$56,368	\$842	\$796	\$839	\$2,349

Source: 2015 American Samoa Household Income and Expenditures Survey

Medical expenses appeared twice on the survey but in different forms. Results from the first section are shown in the table. About 560 visits were made to diabetes doctors, at a cost of about \$106 per visit, and about 90 visits were made to cardiologists at a cost of about \$2,700 a visit.

Table E03. Medical Expenses by District, American Samoa: 2015

Medical Expenses	Total			Amount			Average		
	Total	Eastern	Western	Total	Eastern	Western	Total	Eastern	Western
Total	2,261	1,038	1,164	\$446,987	\$366,511	\$75,440	\$198	\$353	\$65

Note: Manu'a amounts included in total but not distribution

A section on recreational equipment yielded few purchases. The largest category was for hunting and fishing equipment (mostly fishing) with 360 purchases or about \$172 per purchase. The most expensive purchases were for automobile accessories at almost \$1000 per purchase.

Table E04. Various Equipment Purchases by District, American Samoa: 2015

Various Equipment	Purchases				Amount				Average			
	Total	Eastern	Western	Manu'a	Total	Eastern	Western	Manu'a	Total	Eastern	Western	Manu'a

Source: 2015 American Samoa Household Income and Expenditures Survey

The survey found almost 1,000 cases of households remodeling inside rooms in their units, at an average cost of almost \$3,000. The most expensive costs were for whole dwellings under construction, at an average of about \$7,700 per unit. Other larger numbers of cases included building additional rooms, repairing roofs, air conditioning, and installing window panes.

Table E05. Home Repairs and Construction by District, American Samoa: 2015

Source: 2015 American Samoa Household Income and Expenditures Survey

The survey included a section on purchases of kitchen appliances. The survey found almost 1,300 cases of refrigerator purchases, at an average cost of about \$600. The most expensive appliances were air conditioners (at \$1,500), generators (\$1,200), and water heaters (\$1,000). After refrigerators, washing machine were the most frequently bought.

Table E06. Kitchen Appliances by District, American Samoa: 2015

It is important, again, to remember that the 2015 American Samoa survey was a sample, so when the numbers are inflated, they sometimes emphasize some items more than others. For the items related to television, DVDs, and phones, almost 2,000 purchases were reported as Flat screen TVs during the time period, being valued at \$1 million total, or about \$550 per television. Cellular phones and smart phones were also popular purchases, which is not surprising since many households upgrade their cell phones or buy initial ones.

The survey also had a section likely drug store purchases. About 4,300 drug prescriptions were filled during the survey, with a total cost of about \$625,000, or an individual cost of about \$145. Also, more than 3,300 no-prescription drugs were purchased, at an average cost of about \$76. The largest per-purchase cost was for eyeglasses, at about \$320.

Source: 2015 American Samoa Household Income and Expenditures Survey

The tables above were for a large series of purchases in and around the house. The survey also had other sections for specific practices. For example, the survey asked about off-island travel, including travel between Manu'a and Tutuila. Obviously, most travel off of Tutuila was by air, which is shown in the table. For some reason, boat travel did not show up in the sample selected. But about 282 travel occurrences were within American Samoa. Most off-island was to the United States. About equal numbers of residents went to Hawaii as non-California U.S. Mainland. But Samoa received the largest number of visitors, with about 1,565 visits there. The average air cost for travel was about \$3,700 – about \$3,700 for those living in Eastern District, about \$3,100 for those living in Western District, and about \$2,000 for those living in Manu'a.

Table E16. Travel by District, American Samoa: 2015

Some automobile expenses were reported above. But the survey also had a special section just for automobile purchases, sales, and repairs. Almost 3,000 instances of automobile repair costs were reported in the survey, at an average cost of \$450 per repair. The average purchase price was about \$9,700 and the average selling price was about \$4,300.

Table E17. Selected Automobile Expenses by District, American Samoa: 2015

Note: Manu'a in total but not distribution.

Another section was on education expenses, for all level of education, and for tuition, books, and other incidentals. About 800 children were covered by primary school tuition in the survey, at an individual cost of about \$1,000. Secondary school tuition costs were about \$800, and college tuition costs were about \$1,900.

Source: 2015 American Samoa Household Income and Expenditures Survey

The survey also requested information on remittances going outside the household, including within American Samoa. A total of 4,545 remittances cases had an average amount of about \$1,000, with Eastern District remittances being about \$900 and Western District remittances at about \$1,100. Not all households provided where the remittances were going, so that total is somewhat less. But, as expected, the largest number of remittances went to Samoa, about 1,600, and \$1.4 million total, or about \$900 per remittance. The largest per remittances amounts were to Australia and New Zealand (\$2,100) and other places (\$3,500).

Table E19. Annual Remittances by District, American Samoa: 2015

Remittances	Remittances			Amounts (in \$000)			Average

Note: Manu'a amounts included in total but not distribution

Finally, the regular questionnaire had a section on “other” expenditures, those that did not fit in elsewhere. The largest amount of these was for funerals – about 6,800 cases – and \$18.5 million total and about \$2,700 per instance. Church Activities/Donations was next, with 6,200 cases (averaging \$2,300) and Weddings with 2,230 cases (\$1,100 per case). Many households also contributed frequently to other family events and traditional feasts.

Note: Manu'a included in total but not distribution.

DIARY ITEMS

Daily purchases were reported in a diary that the enumerator gave to the householder during the enumeration. All items purchased were to be reported for a calendar week. The purchases included anything bought at a grocery store or market, farmer's market, or small shop. The purchases were to include beer drunk at a bar, gum for children, and so forth.

Table shows the largest purchases during the one-week diaries. On an inflated basis, the enumerated households made 2,000 purchases of bananas. The average purchase price was 63 cents, with the average household actually purchasing bananas paying about \$5 for all bananas purchases. Some households did not purchase bananas, so the average for all households in the sample was about \$2.50 for bananas.

Redbull had the second largest number of purchases, and the other largest purchases are shown in descending order. The table shows 500 or more purchases by the sample population. All diary purchases are available in the Department of Commerce tables.

Table E21. Selected Diary Item Purchases during One Week, American Samoa: 2015

Source: 2015 American Samoa Household Income and Expenditures Survey

The expenditures data are used to obtain information for developing a current market basket to be used to make a new Consumer Price Index. In addition, the survey provides information about the relationship between income and expenditures. Also, characteristics of the population, like age and sex, education, and economic activity can be crossed with expenditures to obtain information about the relationship of the demographic and social variables and expenditures. Finally, information about the nutrition of the American Samoa population is obtained and can be used to implement programs to alleviate high levels of hypertension, obesity, and diabetes.

ANNUAL EXPENDITURE MAJOR GROUPS

MAJOR GROUP	Annual Purchases	Annual expenditure	Average spent
Food	246,072	\$ 92,494,119.52	\$ 82,133.84
Alcoholic Beverages	1,272	\$ 1,346,348.70	\$ 3,811.48
Housing	102,429	\$ 88,970,473.88	\$ 87,883.15
Apparel	43,930	\$ 22,270,695.19	\$ 15,083.95
Transportation	41,179	\$ 29,552,980.80	\$ 51,441.37

Other Goods and Services	65,036	\$ 70,760,391.23	\$ 92,564.44
ALL EXPENDITURE	557,417	\$ 354,854,695.73	\$ 470,659.44

Source: 2015 American Samoa Household Income and Expenditures Survey

Total combined expenditure for all households in American Samoa amounted to \$355 million. Food accounted for the highest expenditure group with 26.1 percent followed by Housing with 25.1 percent. As in previous household expenditure surveys, alcoholic beverages has always been underreported. The third largest expenditure group is Other Goods and Services with 19.9 percent. This group included religious expenditure such as church activities and donations, and cultural expenditure: funeral, wedding, traditional feasts and others. Medical care and Education have much lower proportions.

The American Samoa marginal propensity to consume is much higher at 98%. This is estimated as total income of \$362.4 million minus total expenditure of \$354.9 million. Only \$7.5 million (2%) can be considered savings.

Of the \$92.5 million worth of Food, \$13.0 million was spent on Poultry products alone. Another \$10.8 million was spent on Food Away from Home with another \$10.5 million on Cereal products including Rice. And of the \$70.8 million worth of Other Goods and Services, \$19.7 million was spent on Funerals, \$16.5 million spent on Church and Religions activities, \$6.7 million was remitted outside of American Samoa and \$2.5 million spent on Weddings.
